## Question 2:

What are the limitations of J.J. Thomson's model of the atom?

### Answer 2:

According to J.J. Thomson's model of an atom, an atom consists of a positively charged sphere with electrons embedded in it. However, it was later found that the positively charged particles reside at the center of the atom called the nucleus, and the electrons revolve around the nucleus.

## Question 3:

What are the limitations of Rutherford's model of the atom?

### Answer 3:

According to Rutherford's model of an atom, electrons revolve around the nucleus in fixed orbits. But, an electron revolving in circular orbits will not be stable because during revolution, it will experience acceleration. Due to acceleration, the electrons will lose energy in the form of radiation and fall into the nucleus. In such a case, the atom would be highly unstable and collapse.

## Question 4:

Describe Bohr's model of the atom.

### Answer 4:

Bohr's model of the atom Niels Bohr proposed the following postulates regarding the model of the atom.

- Only certain orbits known as discrete orbits of electrons are allowed inside the atom.
- While revolving in these discrete orbits, the electrons do not radiate energy. These discrete orbits or shells are shown in the following diagram.

The first orbit (i.e., for  $n = 1$ ) is represented by letter K. Similarly, for  $n = 2$ , it is L - shell, for  $n = 3$ , it is M - shell and for  $n = 4$ , it is N - shell. These orbits or shells are also called energy levels.
