

Graphing and Analyzing Scientific Data

Graphing is an important procedure used by scientist to display the data that is collected during a controlled experiment. There are three main types of graphs:

Pie/circle graphs: Used to show parts of a whole.

Bar graphs: Used to compare amounts.

Line graphs: Use to show the change of one piece of information as it relates to another change.

Both bar and line graphs have an "X" axis (horizontal) and a "Y" axis (vertical).

Parts of a Graph:

Title: Summarizes information being represented in ANY graph.

Independent Variable: The variable that is controlled by the experimenter, such as, time, dates, depth, and temperature. This is placed on the X axis.

Dependent Variable: The variable that is directly affected by the I.V. It is the result of what happens as time, dates, depth and temperature are changed. This is placed on the Y axis.

Scales for each Variable: In constructing a graph, one needs to know where to plot the points representing the data. In order to do this a scale must be employed to include all the data points.

A. Graph the following information in a **BAR** graph. Label and number the x and y-axis appropriately.

Managing and Mining Graph Data Charu C. Aggarwal, Haixun Wang, 2010-02-02 Managing and Mining Graph Data is a comprehensive survey book in graph management and mining. It contains extensive surveys on a variety of important graph topics such as graph languages, indexing, clustering, data generation, pattern mining, classification, keyword search, pattern matching, and privacy. It also studies a number of domain-specific scenarios such as stream mining, web graphs, social networks, chemical and biological data. The chapters are written by well-known researchers in the field and provide a broad perspective of the area. This is the first comprehensive survey book in the emerging topic of graph data processing. Managing and Mining Graph Data is designed for a varied audience composed of professors, researchers, and practitioners in industry. This volume is also suitable as a reference book for advanced-level database students in computer science and engineering.

The Practitioner's Guide to Graph Data Denise Gosnell, Matthias Broecheler, 2020-03-20 Graph data closes the gap between the way humans and computers view the world. While computers rely on static rows and columns of data, people navigate and reason about life through relationships. This practical guide demonstrates how graph data brings these two approaches together. By working with concepts from graph theory, database schema, distributed systems, and data analysis, you'll arrive at a unique intersection known as graph thinking. Authors Denise Koessler Gosnell and Matthias Broecheler show data engineers, data scientists, and data analysts how to solve complex problems with graph databases. You'll explore templates for building with graph technology along with examples that demonstrate how teams think about graph data within an application. Build an example application architecture with relational and graph technologies. Use graph technology to build a Customer 360 application, the most popular graph data pattern today. Dive into hierarchical data and troubleshoot a new paradigm that comes from working with graph data. Find paths in graph data and learn why your trust in different paths motivates and informs your preferences. Use collaborative filtering to design a Netflix-inspired recommendation system.

Efficient and scalable graph view maintenance for deductive graph databases based on generalized discrimination networks Beyhl, Thomas, Giese, Holger, 2016-01-12 Graph databases provide a natural way of storing and querying graph data In contrast to relational databases queries over graph databases enable to refer directly to the graph structure of such graph data For example graph pattern matching can be employed to formulate queries over graph data However as for relational databases running complex queries can be very time consuming and ruin the interactivity with the database One possible approach to deal with this performance issue is to employ database views that consist of pre computed answers to common and often stated queries But to ensure that database views yield consistent query results in comparison with the data from which they are derived these database views must be updated before queries make use of these database views Such a maintenance of database views must be performed efficiently otherwise the effort to create and maintain views may not pay off in comparison to processing the queries directly on the data from which the database views are derived At the time of writing graph databases do not support database views and are limited to graph indexes that index nodes and edges of the graph data for fast query evaluation but do not enable to maintain pre computed answers of complex queries over graph data Moreover the maintenance of database views in graph databases becomes even more challenging when negation and recursion have to be supported as in deductive relational databases In this technical report we present an approach for the efficient and scalable incremental graph view maintenance for deductive graph databases The main concept of our approach is a generalized discrimination network that enables to model nested graph conditions including negative application conditions and recursion which specify the content of graph views derived from graph data stored by graph

databases The discrimination network enables to automatically derive generic maintenance rules using graph transformations for maintaining graph views in case the graph data from which the graph views are derived change We evaluate our approach in terms of a case study using multiple data sets derived from open source projects
