Chemistry is Phenomenal Tracy Poulsen,

The Distribution of Suspended Particulate Matter Off the California Coast from San Francisco Bay to Cape San Martín Lawrence Florian Diddlemeyer, 1975

The distribution of suspended particulate matter in the 1.4 to 27.9 micron range based on data gathered during four cruises off the California coast from San Francisco Bay to Cape San Martin is presented by means of isometric drawings as well as more conventional graphs. It was observed that pycnoclines set up particle traps. In areas where a deep mixed layer existed, particle concentrations were randomly distributed in the layer. Counts of larger sized particles decreased with depth; those for smaller particles appeared to remain about constant throughout the water column. Particle sizes and distributions reflected bottom topography and water depth. Shallow water stations exhibited higher particle concentrations while stations over Monterey Canyon showed depressed counts over the entire size range. In localized upwelling areas, higher concentrations around the areas peripheries than in their centers were found. C values generally occurred in the 2.4 to 3.1 range but significant deviations were noted during upwelling. K values often fell in the 50 to 300 x 10³ particles m⁻¹ range but extremely high values were noted for the Davidson Current period. Phytoplankton blooms appeared to be responsible for knees or peaks in many of the size distributions.

Particle Production in Highly Excited Matter Hans H. Gutbrod, Johann

Rafelski, 2012-12-06. Seven years after the first experiments in the new field of Nuclear Physics, the Highly Relativistic Heavy Ion Physics, the NATO Advanced Study Institute on the Particle Production in Highly Excited Matter was held from July 12 till July 24, 1992, at Il Ciocco, Castelveccchio Pascoli near Lucca in Italy. The school took place at a moment when intensive efforts are mounted by the scientific community of Relativistic Heavy Ion Physics to meet the extraordinary challenge of the new upcoming physics opportunities. The gold beams of 10 GeV/A at Brookhaven AGS have been sent to the experiments this Summer and we extend our congratulations to the persons and teams who made this possible. The Relativistic Heavy Ion Collider RHIC at Brookhaven is under construction and expected to allow experiments to see collisions in the intersection regions early 1998. The lead beams at the SPS at CERN scheduled for summer 1994 are eagerly awaited by 6 large experiments and many scientists are planning the experiments at the planned LHC with heavy ions to be turned on before the year 2000. Seen against this background of rather fierce activity, we were most delighted when NATO accepted our application for an Advanced Study Institute oriented to the main subject of this young and dynamic field of research. We are very grateful to the Scientific Affairs Division of NATO and Dr L. DaCunha, the director of the Advanced Study Institute program, for giving our community this opportunity.
