Abstract: Reinforcement learning, a subset of machine learning in the field of engineering informatics, has revolutionized the decision-making and control of industrial pumping systems. A set of 100 peer-reviewed papers on the application of reinforcement learning to pumps, sourced from the Scopus database, were selected. The selected papers were subjected to bibliometric and content analyses. The existing approaches in use, the challenges that have been experienced, and the future trends in the field are all explored in depth. The majority of the studies focused on developing a control system for pumps, with heat pumps being the most prevalent type, while also considering their economic impact on energy consumption in the industry. Future trends include the use of Internet-of-Things sensors on pumps, a hybrid of model-free and model-based reinforcement learning algorithms, and the development of “weighted” models. Finally, ideas for developing a practical reinforcement learning-bundled software for the industry are presented to create an effective system that includes a comprehensive reinforcement learning framework application.

1. Introduction

A pump is a mechanical device that converts electrical energy into hydraulic energy and uses it to move fluids or slurries. Pumps are used in a variety of industries, including water treatment plants; automobile factories; industrial plants; energy industries; oil and gas industries; heating, ventilation, and air conditioning (HVAC) systems; and medical facilities, among others. Pump performance research is primarily focused on two goals: improving pump reliability and lowering energy usage in the industry [1,2]. In the literature, there are several strategies based on artificial intelligence (AI) methods for solving the challenges mentioned above in a manufacturing firm [3]. Some of these AI methods include areas such as engineering informatics [4–7]. In our work, however, we limit our review to reinforcement learning techniques applied to pump systems. Pump reliability is frequently improved by forecasting the remaining useful life of the pump; examples can be found in some works (see [8,9]). Pump maintenance procedures that are optimized tend to lower maintenance costs, which in turn reduces industrial energy consumption [10,11]. However, the application of reinforcement learning to the pump system or rotating machinery comprising pumps shows an interesting trend toward better and improved control pumping systems that integrate the two-fold performance indices [12–14].

Reinforcement learning (RL), which is derived from a neutral stimulus and a response, is a type of machine learning algorithm that has grown in popularity due to its ability to
