

Ultrasound scanning of fetal anomaly

Lung sequestration diagnosed on ultrasound at 20 weeks of gestation. e=echogenic lung, v=vessel arising from aorta.

The role of ultrasound has evolved, especially in countries where a routine first trimester scan has been introduced. The National Institute of Clinical Excellence (NICE) has recommended that all pregnant women be offered two scans in pregnancy – the first at 11–13 weeks of gestation and the second between 18+0 and 20+6 weeks of gestation.

The purpose of the first trimester scan is to:

- establish gestational age
- detect multiple pregnancy and chorionicity
- measure fetal nuchal translucency as part of the combined test for the detection of Down syndrome
- detect fetal structural abnormalities

The main focus of the second trimester scan is the identification of fetal structural malformations. It also plays an important role in fetal biometry, liquor volume assessment and placental assessment. The majority of women have a normal result and are reassured by this. A small proportion of women will have an abnormal result, and will turn to their obstetrician to provide them with further information.

This tutorial will help you to learn more about the fetal anomaly scan as a screening test, and the management of some of the abnormalities that may be detected.
