

PHYSICAL SCIENCE PRACTICE TEST WITH ANSWER KEY

1. A weak attraction between hydrogen atom in one molecule and an oxygen in other called _____.
A. covalent bond
B. Hydrogen bond
C. Ionic bond
D. Metallic bond
2. Which of the following substances is most likely a covalent compound?
A. CaCO_3
B. KNO_3
C. SO_2
D. NaOH
3. What is the element needed to bond with Na to create the most ionic bond?
A. F
B. Cl
C. Br
D. I
4. The boiling point of substance A is higher than that of substance B. What does this mean?
A. Substance A is less viscous than substance B.
B. Substance A evaporates faster than substance B.
C. Substance B has greater surface tension than substance A.
D. Substance B has weaker intermolecular forces than substance A.
5. What is the intermolecular force of attraction between the nucleus of one atom and the electrons of a nearby atom?
A. Dipole-dipole force
B. Ion-dipole force
C. London dispersion force
D. Van der Waals force
6. Which of the following has the greatest number of atoms?
A. Ca(OH)_2
B. Al_2O_3

Extension of Latin Hypercube Samples with Correlated Variables William L. Oberkampf,Timothy Guy Trucano,2007 Verification and validation V V are the primary means to assess the accuracy and reliability of computational simulations V V methods and procedures have fundamentally improved the credibility of simulations in several high consequence fields such as nuclear

reactor safety underground nuclear waste storage and nuclear weapon safety Although the terminology is not uniform across engineering disciplines code verification deals with assessing the reliability of the software coding and solution verification deals with assessing the numerical accuracy of the solution to a computational model Validation addresses the physics modeling accuracy of a computational simulation by comparing the computational results with experimental data Code verification benchmarks and validation benchmarks have been constructed for a number of years in every field of computational simulation However no comprehensive guidelines have been proposed for the construction and use of V V benchmarks For example the field of nuclear reactor safety has not focused on code verification benchmarks but it has placed great emphasis on developing validation benchmarks Many of these validation benchmarks are closely related to the operations of actual reactors at near safety critical conditions as opposed to being more fundamental physics benchmarks This paper presents recommendations for the effective design and use of code verification benchmarks based on manufactured solutions classical analytical solutions and highly accurate numerical solutions In addition this paper presents recommendations for the design and use of validation benchmarks highlighting the careful design of building block experiments the estimation of experimental measurement uncertainty for both inputs and outputs to the code validation metrics and the role of model calibration in validation It is argued that the understanding of predictive capability of a computational model is built on the level of achievement in V V activities how closely related the V V benchmarks are to the actual application of interest and the quantification of uncertainties related to the application of interest Construct-a-boat William Baroway, Technical Education Research Centers (U.S.), 2000 Challenges high school students to investigate the physics of boat performance to work with systems modeling Physics of Plutonium Recycling: Fast plutonium-burner reactors: beginning of life NEA Nuclear Science Committee.
