Zaytsev,Georgiy G. Aseyev,1992-08-24 Properties of Aqueous Solutions of Electrolytes is a handbook that systematizes the information on physico chemical parameters of multicomponent aqueous electrolyte solutions This important data collection will be invaluable for developing new methods for more efficient chemical technologies choosing optimal solutions for more effective methods of using raw materials and energy resources and other such activities This edition the first available in English has been substantially revised and augmented Many new tables have been added because of a significantly larger list of electrolytes and their properties electrical conductivity boiling and

freezing points pressure of saturated vapors activity and diffusion coefficients The book is divided into two sections The first section provides tables that list the properties of binary aqueous solutions of electrolytes while the second section deals with the methods for calculating their properties in multicomponent systems All values are given in PSI units or fractional and multiple units Metrological characteristics of the experimental methods used for the determination of physico chemical parameters are indicated as a relative error and those of the computational methods as a relative error or a root mean square deviation

Sol-gel processing Sumio Sakka,2005 Since Dr Dislich of Germany prepared a glass lens by the sol gel method around 1970 sol gel science and technology has continued to develop Since then this field has seen remarkable technical developments as well as a broadening of the applications of sol gel science and technology There is a growing need for a comprehensive reference that treats both the fundamentals and the applications and this is the aim of Handbook of Sol Gel Science and Technology The primary purpose of sol gel science and technology is to produce materials active and non active including optical electronic chemical sensor bio and structural materials This means that sol gel science and technology is related to all kinds of manufacturing industries Thus Volume 1 Sol Gel Processing is devoted to general aspects of processing Newly developed

materials such as organic inorganic hybrids photonic crystals ferroelectric coatings photocatalysts will be covered Topics in this volume include Volume 2 Characterization of Sol Gel Materials and Products highlights the important fact that useful materials are only produced when characterization is tied to processing Furthermore characterization is essential to the understanding of nanostructured materials and sol gel technology is a most important technology in this new field Since nanomaterials display their functional property based on their nano and micro structure characterization is very important Topics found in Volume 2 include Sol gel technology is a versatile technology making it possible to produce a wide variety of materials and to provide existing substances with novel properties This technology was applied to producing novel materials for example organic inorganic hybrids which are quite difficult to make by other fabricating techniques and it was also applied to producing materials based on high temperature superconducting oxides Applications of Sol Gel Technology Volume 3 will cover applications such as
