Recombination during meiosis

Recombination is the exchange of DNA segments between non-sister chromatids of a pair of homologous chromosomes. This process occurs during Prophase I of Meiosis I. Recombination results in the formation of new genetic combinations. Recombination is shown in Figure 3. Recombination is an important process in the formation of genetic diversity.

Answer Key Meiosis And Mendel:

Introduction to Genetics Sandra Pennington, 2009-07-17 The 11th Hour Series of revision guides are designed for quick reference. The organization of these books actively involves students in the learning process and reinforces concepts. At the end of each chapter, there is a test including multiple choice questions, true/false questions, and short answer questions, and every answer involves an explanation. Each book contains icons in the text indicating additional support on a dedicated web page. Students having difficulties with their courses will find this an excellent way to raise their grades. Clinical correlations or everyday applications include examples from the real world to help students understand key concepts more readily. Dedicated web page, 24 hours a day, will give extra help, tips, warnings of trouble spots, extra visuals, and more. A quick check on what background students will need to apply helps equip them to conquer a topic. The most important information is highlighted and explained, showing the big picture and eliminating the guesswork. After every topic and every chapter, lots of opportunity for drill is provided in every format: multiple choice, true/false, short answer, essay. An easy trouble spot identifier demonstrates which areas need to be reinforced and where to find information on them. Practice midterms and finals prep them for the real thing.
