

C. Return to the following pedigree for questions 12 – 16.

12. The pedigree above shows a family's pedigree for colorblindness. Which row contains the numbers of colorblindness and not have it? [From this pedigree, above, it can be seen that only the females are carriers for colorblindness]
13. Based on your answer to question 12, what kind of trait is colorblindness? [Sex-linked, recessive. In X-linked recessive disorders, two recessive alleles are needed to cause disease in females and one recessive allele is enough to cause disease in males. This is because males have XY and females have XX. If there is female has one dominant and one recessive allele then she will be a carrier for the disease or disorder.]
14. Why does individual IV-7 have colorblindness? [The father of IV-7 is colorblind and her mother is a carrier. Therefore she received one allele from both parents.]
15. Why do all the daughters in generation II carry the colorblind gene? [They all carry the colorblind gene because their father is colorblind, thus they all received the recessive allele from him.]
16. Identify or name the colorblind males in generations IV. [The colorblind males in generations IV are IV-1 and IV-5.]

**Handbook on Analyzing Human Genetic Data** Shili Lin, Hongyu Zhao, 2009-10-13 The discipline of statistical genetics is highly computational. Both exact computational methods and simulation-based or hybrid of the two computational packages are indispensable tools and constant companions of researchers in the field. This handbook is intended to provide human geneticists and other biomedical researchers with guidance on selections of appropriate computational methods and software packages for their specific genetic problems. It may also be used by students and other learners as a reference in conjunction with a more theoretical and/or methodologically oriented textbook. This book tries to strike a balance between methodological expositions and practical guidelines for software selections. Wherever possible, comparisons among the competing methods and software are made to highlight the relative advantages and disadvantages of the approaches so that the reader can make informed choices to best match their specific needs. Human genetics has been undergoing an evolution in the past several years as new knowledge and technologies are transforming the field, leading to numerous new discoveries of genes associated with complex traits such as cancer, obesity, and diabetes. Many recent genome-wide association studies employ the case-control design where the study subjects consist of unrelated affected individuals and normal controls. For each individual, a large number of genetic markers are queried.

Other chapters treat transmission genetics, molecular genetics, and evolutionary genetics and provide an understanding of the basic process of gene transmission, mutation, expression, and regulation.
