

Important Ideas:

LT#1 Predictions

$$\hat{y} = a + bx$$

↑ predicted ↑ y-int ↑ slope

* Be careful of extrapolation.

LT#2 Residuals

Residual = Actual - Predict.

$$R = A - P$$

"The actual context was residual above/below the predicted value for x = #."

LT#3 y-int & Slope

y-int: "When x=0 context the predicted y-context is y-int."

Slope: "With each additional x-context the predicted y-context increases/decreases by slope."

Check Your Understanding:

Michael is a runner. He uses his Apple watch to keep track of his distance and the number of calories he burns for 20 runs. A scatterplot of y = calories burned and x = distance (in miles) shows a fairly strong, positive linear relationship. The regression equation $\hat{y} = 20 + 160x$ models the data fairly well.

a. Interpret the slope of the regression line.

With each additional mile run, the predicted number of calories burned increases by 160 calories.
