Amoeba Sisters Video Recap: Cell Transport

The cell membrane is important for maintaining homeostasis, because it controls what enters and leaves a cell.

1. Skietch the

phospholipid bilayer of a cell membrane below and label the polar heads and nonpolar tails.

- Polar heads
- Nonpolar tails

2. What is simple diffusion?

"Diffusion that doesn't take any energy to force these molecules in or out so this is known as passive

transport. Simple diffusion moves with the flow.

Meaning, it moves with the concentration gradient."

- Circle the statements below that would be TRUE about simple diffusion. HINT: There is more than one!
 - A) It is a form of passive transport.
 - Molecules travel with the concentration gradient.
 - It is how glucose travels across the cell membrane.
 - It is how oxygen and carbon dioxide travel across the membrane.
 - E) This transport is typical for large molecules.

Moving with the Concentration Gradient

4. "Moving with the flow" (i.e. going with the concentration gradient) is the direction of flow in passive transport. Show this in the diagram on right by drawing in 10 total circles (to represent molecules). You must decide a certain amount to place on the left vs. the right side after viewing the arrow indicating the direction of movement. Label the high concentration side and low concentration side.

Endocytosis and Exocytosis

5. Are endocytosis and exocytosis forms of passive or active transport? Active Transport

6. Give a scenario where a cell may need to perform a form of endocytosis. <u>"Amoebas for example rely on</u> endocytosis. Pseudopods stretch out around what they want to engulf and then it gets pulled into a vacuole."

7. Give a scenario where a cell may need to perform a form of exocytosis. "Cell walls are different from cell membranes- all cells have membranes but not all cells have a wall. But if you are going

to make a cell wall, you're going to need to get those carbohydrates that are produced in the plant of the cell out of the cell to make the wall."
