Modulating Prokaryotic Lifestyle by DNA-Binding Proteins Tatiana Venkova,Antonio Juarez,Manuel Espinosa,2017-03-07

The Overview of the Topic was the following One of the most active areas of research in molecular microbiology has been the study of how bacteria modulate their genetic activity and its consequences The prokaryotic world has gained a lot of interest In addition to the above the invention is based on the subject matter of the present invention which is incorporated herein by reference in its entirety All of these processes are fundamental to the operation of a genetic entity and condition their lifestyle Further the discoveries in the bacterial world have been of ample use in eukaryotes Article in German Hansen Hansen H 2003 In addition to the fundamental interest in understanding modulation of prokaryotic lifestyle by DNA binding proteins As it is well known the antibiotic resistance strains of pathogenic bacteria are a major world problem so that there is an urgent need of innovative technologies to tackle it Most of the patients are infected with the virus It is an imperative of finding new alternatives to the classical way of treatment of bacterial infections and these new alternatives Nevertheless These new alternatives will find a dead end if we are unable to obtain a better understanding of the basic processes modulating bacterial gene expression Our goal is to achieve our understanding of protein DNA interactions First the topic will bring together a lot of very active research in the study of gene replication gene regulation the strategies We therefore want to acquire an in depth knowledge of some of the mechanisms of gene regulation gene transfer and gene replication Further the readers of the papers will realize the importance of the topic and will learn the most recent thinking results and approaches in the area We are fully confident that we have exceeded our expectations Now we are proud to present the final output of the topic which is the eBook It includes 24 articles contributed by 118 authors As of today March 16th January 2017 the total number of readings has reached 19 284 14 921 article views and 2 944 article downloads **Architectural**

Genetic and Epigenetic Control on Immune Responses Regulating Molecules in Cancer Development, Progression, and Treatment Katherine Chiappinelli, Alejandro Villagra, Lidia Karabon, 2024-10-16 In line with recent evidence the development of cancer has been described as uncontrolled cell growth that results from gradual accumulation of genetic and epigenetic alterations involving aberrations in oncogenes tumor suppressor genes and defects in genes engaged in DNA repair As a result cancer cells acquire a neoplastic phenotype and tumor associated antigens TAAs are presented on their surface These target structures should be recognized by cells of the immune system However a sequence of events at the genetic and epigenetic level disturb immune cells and in consequence make them unable to eliminate cancer cells Both innate and adaptive immunity are mobilized against cancer cells In response to the appearance of cells with malignant transformation NK cells release perforin and granzyme causing direct cytolysis of the target cells They can also secrete pro inflammatory cytokines and in that way enhance the anticancer response The activity of NK cells is regulated by a variety of activating and inhibitory receptors including NKG2D KIR CD94 NKG2 heterodimers and natural cytotoxicity receptors TNF family ligands as well as co stimulatory receptors which recognize related molecules on target cells A fundamental trigger of the anticancer immune response is the recognition of TAAs by T cells via the major histocompatibility complex MHC which should be followed by signals from co stimulatory molecules Full activation of T lymphocytes requires a third signal provided by the presence of cytokines and this leads to cell proliferation differentiation and secretion of chemokines and cytokines The effect is to drive the clonal expansion of the T

cells directed against TAAs and to recruit other immune effector cells in order to enhance immune defense **Haines San**
