

Unit 5: Thermochemistry**5.1: Heat Transfer and Thermal Equilibrium****5.2: Heat Capacity and Calorimetry****5.3: Entropy and Spontaneous Changes**

2. Use the Boltzmann-probability distribution curves below to predict temperatures of the mixtures of particles.

Temperature: is a measure of the average kinetic energy of the particles in a system. The kinetic energy for particles moving with v is $\frac{1}{2}mv^2$, so the more of particles that move fast enough, the more kinetic energy we will see for a system. Therefore, the more particles move faster, the more kinetic energy we will see for the system. It's important to note that the more particles move faster, the more kinetic energy we have.

3. Sketch what you expect to represent the relative distribution of the particles in the following two parts: samples of the same gas.

- a. In System 1, it is a higher or lower temperature than System 2? Justify your answer.
System 1 is at a higher temperature than System 2. Temperature is a measure of the average KE of the particles in the system. In System 1, the particles have more kinetic energy, so the average KE of the particles is higher. In System 2, the particles have less kinetic energy, so the average KE of the particles is lower. Therefore, System 1 is at a higher temperature than System 2.
- b. In which direction will kinetic energy be transferred? Justify your answer in terms of molecular collisions.
Kinetic energy will be transferred from System 1 to System 2. In System 1, the particles have more kinetic energy, so they will collide with the particles in System 2, which have less kinetic energy. This will transfer kinetic energy from System 1 to System 2. The particles in System 1 will have more kinetic energy after the collision, and the particles in System 2 will have less kinetic energy after the collision. This will continue until the two systems reach thermal equilibrium.
