

Using Graphing Skills

Introduction

Recorded data can be plotted on a graph. A graph is a pictorial representation of information recorded in a data table. It is used to show a relationship between two or more different factors. Two common types of graphs are line graphs and bar graphs. In this investigation, you will interpret and construct a bar graph and a line graph.

Problem

How do you correctly interpret and construct a line graph and a bar graph?

Pre-Lab Discussion

Read the entire investigation. Then, work with a partner to answer the following questions.

1. Would a line graph or a bar graph be better for showing the number of birds of each color in a population?

2. How could you plot more than one responding variable on a line graph?

3. Where do you place the manipulated variable on a line graph?

4. Which type of graph would you use to show comparisons? Explain the reason for your answer.

5. Why is it important to have all parts of a graph clearly labeled and drawn?

Procedure

Part A. Interpreting Graphs

1. The type of graph that best shows the relationship between two variables is the line graph. A line graph has one or more lines connecting a series of points. See Figure 1. Along the horizontal axis, or x -axis, you will find the manipulated variable in the experiment. Along the vertical axis or y -axis, you will find the responding variable.
