International Conference on Education and Management Science (ICEMS2014), 2014-09-24 2014 International Conference on Education and Management Science ICEMS2014 will be held in Beijing China on August 19 20 2014 The main purpose of this conference is to provide a common forum for researchers scientists and students from all over the world to present their recent findings ideas developments and application in the border areas of Education and Management Science It will also report progress and development of methodologies technologies planning and implementation tools and standards in information systems Education is an internal topic It is a process of delivering knowledge in a basic meaning Humans are hard to define the actual definition of education But it is the key point for our society to step forward Management science is the discipline that adapts the scientific approach for problem solving to help managers making informed decisions The goal of management science is to recommend the course of action that is expected to yield the best outcome with what is available

Marine Anthropogenic Litter Melanie Bergmann, Lars Gutow, Michael Klages, 2015-06-01 This book describes how man made litter primarily plastic has spread into the remotest parts of the oceans and covers all aspects of this pollution problem from the impacts on wildlife and human health to socio economic and political issues Marine litter is a prime threat to marine wildlife habitats and food webs worldwide The book illustrates how advanced technologies from deep sea research microbiology and mathematic modelling as well as classic beach litter counts by volunteers contributed to the broad awareness of marine litter as a problem of global significance The authors summarise more than five decades of marine litter research which receives growing attention after the recent discovery of great oceanic garbage patches and the ubiquity of microscopic plastic particles in marine organisms and habitats In 16 chapters authors from all over the world have created a universal view on the diverse field of marine litter pollution the biological impacts dedicated research activities and the various national and international legislative efforts to combat this environmental problem They recommend future research directions necessary for a comprehensive understanding of this environmental issue and the development of efficient management strategies This book addresses scientists and it provides a solid knowledge base for policy makers NGOs and the broader public

Bio-orthopaedics Alberto Gobbi, João Espregueira-Mendes, John G. Lane, Mustafa Karahan, 2017-05-26 This book introduces the exciting field of orthobiology which will usher in a new array of therapeutic approaches that stimulate the body's natural resources to regenerate musculoskeletal tissues damaged by trauma or disease The book addresses a range of key topics and discusses emerging approaches that promise to offer effective alternatives to traditional treatments for injuries to bone cartilage muscles ligaments and tendons It explains in detail how a variety of innovative products including biomaterials growth factors and autogenous cells together provide the basis for the regeneration of these musculoskeletal structures and how recent scientific progress has created unique opportunities to address pathological situations that until recently have been treated with unsatisfactory results The authors are experts from across the world

who come together to provide a truly global overview The book is published in collaboration with ISAKOS It will be invaluable for all with an interest in this area of medicine which has already attained huge popularity in Orthopaedics and Sports Medicine and has also attracted the attention of the lay public Achieving Your Best in High School Charles P. Kost II, 2015-01-16 This collection of self guided lessons includes the essential skills that are needed to be successful in high school and beyond Students who are new to high school or students who are struggling in class as well as students who want to maximize their achievement in school will find these easy to implement strategies effective and practical Each lesson includes easy to adapt techniques that can be integrated into everyday practice The strategies are divided into six units each focusing on different aspects of student achievement From adapting to high school to organization and study skills to setting goals this book will introduce all of the necessary components of being a successful high school student These techniques will be an asset to any student in high school and college and throughout the rest of their careers **The Neuron in Context**

Vanessa Lux, 2024-09-17 Neuroscience has largely abandoned its localizationist and mechanistic framework of the 20th century The plastic embodied and network character of our nervous system is widely acknowledged and systems theory approaches to consciousness dominate the field However the underlying neuron theory has not changed The neuron doctrine conceptualizing the single neuron as atomistic one directional source of neural function still provides the template for our understanding of these basic elements of our nervous system and the material foundation of consciousness Yet the single neuron does not exist as an isolated unit It is embedded within multiple cellular structural and functional contexts and highly depends on them for its development neural activity and survival The book discusses the constraints of the neuron doctrine and its pragmatic reductionism in the light of the growing knowledge about the brain s connectivity plasticity and systemic and embodied nature To overcome these constraints the author argues for a new neuron theory depicting the neuron as bidirectional hub which is at the same time source and product of neural function This bidirectionality is further characterized by spatial and time dimensions placing the neuron within a multi level pathway model of psychobiological development from the perspective of Developmental Embodiment Research Furthermore the author discusses the potential of neuroepigenetic markers to characterize the neuron and its range of plasticity within this developmental perspective With its focus on neuroepigenetics the book addresses a knowledge gap in the current study of the neural foundations of psychological functions The multi level and bidirectional perspective is already realized in approaches coming from developmental systems theory which model neural function at the connectome level and it also fits with approaches investigating feedback loops underlying neural activity at the single cell level At both these levels the spatial and the time dimensions are well characterized either as changing connectivity patterns across different age groups or as synaptic feedback loops underlying neural activation patterns However for the intermediate level of small neural populations which is currently the main target for studies investigating the neural basis of specific psychological functions this characterization

turned out to be more challenging Multi cell recordings have provided a first glimpse into the complex interaction patterns of these small neural networks but they are limited to the recording period and do not provide information about the long term developmental and activation history Here neuroepigenetic markers could be of use Due to their relative stability and at the same time environmental sensitivity neuroepigenetic markers represent an additional layer of information in which to a certain degree the cell s metabolic and activation history is aggregated over time This information is available at the single neuron level but could also be modeled as aggregated information for small neural populations and the supporting cellular context Looking through this epigenetic lens adds to our understanding of the neuron as bidirectional hub by emphasizing the molecular correlates of functional stabilization and their contextual prerequisites These prerequisites reach from the immediate cellular context to the social cultural contexts which shape the culturally specific modes of acquisition of psychological functions throughout the lifespan Accounting for this multilayered contextuality of the neuron and its function affords to repositions the relationship between neuroscience and psychology in their joint effort to unravel the material basis of consciousness This provides new challenges but also new perspectives for theoretical psychology The book presents these current developments and debates to researchers graduate students and interested professionals and practitioners working in neuroscience epigenetics psychiatry psychology and psychotherapy It also provides a basic introduction into neuroepigenetics its mechanisms and first findings for graduate students as well as interested professionals and practitioners working in psychiatry psychology and psychotherapy

Emerging zoonoses: eco-epidemiology, involved mechanisms and public health implications Rubén Bueno-Marí, A. Paulo Gouveia Almeida, Juan Carlos Navarro, 2015-07-06 Zoonoses are currently considered as one of the most important threats for public health worldwide Zoonoses can be defined as any disease or infection that is naturally transmissible from vertebrate or

invertebrate animals to humans and vice versa Approximately 75% of recently emerging infectious diseases affecting humans are diseases of animal origin approximately 60% of all human pathogens are zoonotic All types of potential pathogenic agents including viruses parasites bacteria and fungi can cause these zoonotic infections From the wide range of potential vectors of zoonoses insects are probably those of major significance due to their abundance high plasticity and adaptability to different kinds of pathogens high degrees of synanthropism in several groups and difficulties to apply effective programs of population control Although ticks flies cockroaches bugs and fleas are excellent insects capable to transmit viruses parasites and bacteria undoubtedly mosquitoes are the most important disease vectors Mosquito borne diseases like malaria dengue equine encephalitis West Nile Mayaro or Chikungunya are zoonoses with increasing incidence in last years in tropical and temperate countries Vertebrates can also transmit serious zoonoses highlighting the role of some carnivorous animals in rabies dissemination or the spread of rodent borne diseases in several rural and urban areas Moreover the significance of other food borne zoonoses such as taeniasis trichinellosis or toxoplasmosis may not been underestimated According to WHO FAO and OIE guidelines an emerging zoonotic disease can be defined as a zoonosis that is newly recognized or newly evolved or that has occurred previously but shows an increase of incidence or expansion in geographical host or vector range There are many factors that can provoke or accelerate the emergence of zoonoses such as environmental changes habitat modifications variations of human and animal demography pathogens and vectors anomalous mobilization related with human practices and globalization deterioration of the strategies of vector control or changes in pathogen genetics To reduce public health risks from zoonoses is absolutely necessary to acquire an integrative perspective that includes the study of the complexity of interactions among humans animals and environment in order to be able to fight against these issues of primary interest for human health In any case although zoonoses represent significant public health threats many of them still remain as neglected diseases and consequently are not prioritized by some health international organisms

A Living History of Immunology Kendall Arthur Smith, 2015-11-04 In the highly competitive world of biomedical science often the rush to publish and to be recognized as first with a new discovery concept or method is lost in the hurly burly of the moment as the maddening crowd moves on to the next new thing One of the great things about immunology today is that it has only become mature as a science within the last half century and especially within the past 35 years as a consequence of the revolution of molecular immunology which has taken place only since 1980 Consequently most of those who have contributed to our new understanding of how the immune system functions are still alive and well and still contributing Thus A Living History of Immunology collates many stories from the investigators who actually performed the experiments that have established the frontiers of immunology Accordingly this volume combats revisionist science by those who want to alter history by telling the stories a different way than actually happened In this regard one of the good things about science vs other disciplines is that we have the written record of what was done when it was done and by whom Even so we do not have

the complete story or narrative of how and why experiments were done and what made the differences that led to success This volume captures and chronicles some of these stories from the past fifty years in immunology
