Smales, David C. James, 2008-02-04 With the recent completion of the sequencing of the human genome it is widely anticipated that the number of potential new protein drugs and targets will escalate at an even greater rate than that observed in recent years. However, identification of a potential target is only part of the process in developing these new next generation protein based drugs that are increasingly being used to treat human disease. Once a potential protein drug has been identified the next rate limiting step on the road to development is the production of sufficient authentic material for testing characterization clinical trials and so on. If a protein drug does actually make it through this lengthy and costly process methodology that allows the production of the protein on a scale large enough to meet demand must be implemented. Furthermore large scale production must not compromise the authenticity of the final product. It is also necessary to have robust methods for the purification characterization viral inactivation and continued testing of the authenticity of the final protein product and to be able to formulate it in a manner that retains both its biological activity and lends itself to easy administration. Therapeutic Proteins: Methods and Protocols covers all aspects of protein drug production downstream of the discovery stage. This volume contains contributions from leaders in the field of therapeutic protein expression purification characterization formulation and viral inactivation.

Salinity and drought stress in plants: understanding physiological, biochemical and molecular responses, volume II Muhammad Waseem, PingWu Liu, Sunil Kumar Sahu, Umashankar Chandrasekaran, 2025-07-31 This Research Topic is part of the series Salinity and Drought Stress in Plants: Understanding Physiological Biochemical and Molecular Responses. Drought and salinity are two of the foremost environmental factors which restrict plant growth and yield in several regions of the world especially in arid and semi arid regions. Due to global climate change drought and salinity are predicted to become more widespread and eventually result in reduced plant growth and productivity in numerous plant species. Exposure of plants to extreme drought or salt stress ceases plant growth while plants exposed to moderate stress generally show a slight change in their growth performance. Scientists are facing the challenging task of producing 70% more food to feed an additional 2.3 billion people by 2050. Therefore it is imperative to develop stress resilient crops with better yields under drought and salt stress to meet the food requirements of upcoming generations. Drought and salinity have significant inhibitory impacts on cellular redox regulation with remodelled plant architecture. Salinity hampers plant growth in two phases: the first phase leads to plant growth suppression due to the osmotic effect of ions present in soil solution and the second phase leads to growth inhibition caused by ion toxicity due to the uptake and accumulation of specific ions. The first phase of salt stress is very similar to that of drought stress. However growth under salinity is restricted primarily by osmotic stress. Thus creating drought resistant tolerant species would produce plants well suited to a saline environment. As salinity in its first phase of salt stress is much like that of drought stress common responses to salinity and drought stresses are expected. This Research Topic explores both the common and distinct responses of plants under salinity and drought which modify plant growth and adaptation. Furthermore it will seek to

understand the biochemical physiological and genetic mechanisms which are critical for improving plant tolerance to these environmental stresses In recent years due to the advancement in omics and breeding technologies significant progress has been made in this direction but knowledge gaps still exist The efforts in translating the knowledge gained through basic research should be expedited to achieve the desired outcomes of enhancing crop productivity and ensuring global food and nutritional security To ensure the focus remains on impactful applied research we will not be accepting submissions that are purely descriptive in nature We will include contributions on themes such as Mechanistic insights into plant responses to drought and salinity Understanding of the ROS regulation under salinity and drought stress Tools or resources for engineering drought and salt resistant crops Plant breeding towards stress tolerant crop varieties by developing molecular markers and high throughput approaches The role of signal transduction and signaling cascades in response to drought and salinity The use of multi omics approaches to provide insights into traits defining stress tolerance for crop improvement Physiological molecular and genetic mechanisms underlying adaptation of agronomically important crops to abiotic stresses Functional validation and physiological insights of key genes and proteins involved in stress tolerance Advancement in transcriptomic metabolomic proteomic and genomic integrated breeding approaches for enhancing stress tolerance The introduction of new breeding methods to accelerate the rate of genetic gain for sustainable agriculture while maintaining other core traits

Environmental Challenges and Medicinal Plants Tariq Aftab, 2022-04-19 Medicinal plants supply the ever growing needs of humankind for natural chemicals such as pharmaceuticals nutraceuticals agrochemicals and chemical additives These plants contain bioactive secondary metabolites which possess antimalarial anthelmintic anti inflammatory analgesic antimicrobial antiarthritic antioxidant antidiabetic antihypertensive anticancer antifungal antispasmodic cardioprotective antithyroid and antihistaminic properties Secondary metabolites play a major role in the adaptation of plants to the changing environment and stress condition as they are affected by both biotic and abiotic stress

Humans rely on medicinal plants for various needs since ancient time and their population still seems enough for fulfilling our demands. However, in the foreseeable future, we will be forced to think about the accessibility of resources for future generations. For these reasons, we must look for alternative sustainable options of resources which can protect these immensely important medicinal plants from various stresses induced by challenging environment. Evolving eco friendly methodologies and mechanisms to improve these plants responses to unfavorable environmental circumstances is important in creating significant tools for better understanding of plant adaptations to various abiotic stresses and sustaining the supply of pharmaceuticals as global climate change intensifies. One of the great challenges in the near future will be the sustainable production of medicinal plants under increasing adverse effects of climate change. A combination of adverse demographic factors and climatological perturbations is expected to impact food and pharmaceutical production globally. Despite the induction of several tolerance mechanisms, medicinal plants often fail to survive under environmental extremes. To ensure their sustainable production under adverse conditions, multidisciplinary approaches are needed and useful leads are likely to emerge. However, improving plants performance under restrictive growth conditions requires a deep understanding of the molecular processes that underlie their extraordinary physiological plasticity. This edited volume emphasizes the recent updates about the current research on medicinal plants covering different aspects related to challenges and opportunities in the concerned field. This book is an attempt to bring together global researchers who have been engaged in the area of stress signaling crosstalk and mechanisms of medicinal plants. The book will provide a direction towards implementation of programs and practices that will enable sustainable production of medicinal plants resilient to challenging environmental conditions. Moreover, this book will instigate and commence readers to state of the art developments and trends in this field.

Cold Tolerance in Plants Shabir Hussain Wani, Venura Herath, 2018-11-24 Cold stress is one of the prevalent environmental stresses affecting

crop productivity particularly in temperate regions Numerous plant types of tropical or subtropical origin are injured or killed by non freezing low temperature and display a range of symptoms of chilling injury such as chlorosis necrosis or growth retardation In contrast chilling tolerant species thrive well at such temperatures To thrive under cold stress conditions plants have evolved complex mechanisms to identify peripheral signals that allow them to counter varying environmental conditions These mechanisms include stress perception signal transduction transcriptional activation of stress responsive target genes and synthesis of stress related proteins and other molecules which help plants to strive through adverse environmental conditions Conventional breeding methods have met with limited success in improving the cold tolerance of important crop plants through inter specific or inter generic hybridization A better understanding of physiological biochemical and molecular responses and tolerance mechanisms and discovery of novel stress responsive pathways and genes may contribute to efficient engineering strategies that enhance cold stress tolerance It is therefore imperative to accelerate the efforts to unravel the biochemical physiological and molecular mechanisms underlying cold stress tolerance in plants Through this new book we intend to integrate the contributions from plant scientists targeting cold stress tolerance mechanisms using physiological biochemical molecular structural and systems biology approaches It is hoped that this collection will serve as a reference source for those who are interested in or are actively engaged in cold stress research
