 4. species being classified
 5. clade
 6. node
 7. derived character
 8. a group of organisms that share a common ancestor
 9. Homology: most characters which derived characters are shared by which groups of organisms; the more derived characters a group of organisms has, the later it descended from the common ancestor
10. A node is a place where a branch splits. It represents the most common ancestor shared by a clade. (11. DPA: organisms/groups, nodes and relationships/characters, homology, etc.)
12. As more research is done and the evolutionary histories of different species become better understood, evolutionary trees are rearranged to reflect the most current scientific understanding.
 13. The species are very closely related; they share a relatively recent common ancestor.
 14. A phylogeny shows the origin (the group, or "base," of species).
 15. Cladistics is classification based on evolutionary relationships and a cladogram shows these relationships in a branching-tree diagram.
 16. Derived
 17. The morphology or the other distinct characteristics (traits) of various organisms at the individual or genetic level.
 18. Classified species can evolve similar traits through convergent evolution.
 19. These types of similarities are more likely the result of species sharing a common ancestor that are physical similarities.
 20. naming, classifying
 21. Name
 22. genus, species

SECTION 17.4 DOMAINS AND KINGDOMS

1. Since it reflects the most current understanding of how living things are related, new discoveries can change the way living things are classified.
2. Three hundred years ago, only two kingdoms were recognized. There is no kingdom system in most widely accepted.
3. The research revealed how genetically different groups of prokaryotes, which just had splitting kingdom. Three domains: kingdom. The genetic and cellular differences were too great, that there were kingdoms were genetically/physically different.
