Problems and New Solutions in the Boolean Domain Bernd Steinbach, 2016-04-26. The Internet of Things is a great new challenge for the development of digital systems. In addition to the increasing number of classical unconnected digital systems, more people are regularly using new electronic devices and software that are controllable and usable by means of the internet. All such systems utilize the elementariness of Boolean values. A Boolean variable can carry only two different Boolean values: FALSE or TRUE, 0 or 1, and has the best interference resistance in technical systems. However, a Boolean function exponentially depends on the number of its variables. This exponential complexity is the cause of major problems in the process of design and realization of circuits. According to Moore's Law, the complexity of digital systems approximately doubles every 18 months. This requires comprehensive knowledge and techniques to solve complex Boolean problems. This book summarizes both new problems and solutions in the Boolean domain in solving such issues. Part 1 describes powerful new approaches in solving exceptionally complex Boolean problems. Efficient methods contribute to solving problems of extreme complexity. New algorithms and programs utilize the huge number of computing cores of the Graphical Processing Unit and improve the performance of calculations by several orders of magnitude. Part 2 represents several applications of digital systems. Due to the crucial role of the internet, both solutions and open problems regarding the security of these systems are discussed. The exploration of certain properties of such systems leads to a number of efficient solutions which can be reused in a wide field of applications. Part 3 discusses the scientific basis of future circuit technologies, investigating the need for completely new design methods for the atomic level of quantum computers. This part also concerns itself with reversible circuits as the basis for quantum circuits and specifies important issues regarding future improvements.

Iterative Methods for Solving Nonlinear Equations

and Systems Juan R. Torregrosa, Alicia Cordero, Fazlollah Soleymani, 2019-12-06 Solving nonlinear equations in Banach spaces real or complex nonlinear equations nonlinear systems and nonlinear matrix equations among others is a non trivial task that involves many areas of science and technology Usually the solution is not directly affordable and require an approach using iterative algorithms This Special Issue focuses mainly on the design analysis of convergence and stability of new schemes for solving nonlinear problems and their application to practical problems Included papers study the following topics Methods for finding simple or multiple roots either with or without derivatives iterative methods for approximating different generalized inverses real or complex dynamics associated to the rational functions resulting from the application of an iterative method on a polynomial Additionally the analysis of the convergence has been carried out by means of different sufficient conditions assuring the local semilocal or global convergence This Special issue has allowed us to present the latest research results in the area of iterative processes for solving nonlinear equations as well as systems and matrix equations In addition to the theoretical papers several manuscripts on signal processing nonlinear integral equations or partial differential equations reveal the connection between iterative methods and other branches of science and engineering **Yale Law**

Energy Transfers in Atmosphere and Ocean Carsten Eden,Armin Iske,2019-01-23 This book describes a recent effort combining interdisciplinary expertise within the Collaborative Research Centre Energy transfers in atmosphere and ocean TRR 181 which was funded by the German Research Foundation DFG Energy transfers between the three dynamical regimes small scale turbulence internal gravity waves and geostrophically balanced motion are fundamental to the energy cycle of both the atmosphere and the ocean Nonetheless they remain poorly understood and quantified and have yet to be adequately represented in today s climate models Since interactions between the dynamical regimes ultimately link the smallest scales

to the largest ones through a range of complex processes understanding these interactions is essential to constructing atmosphere and ocean models and to predicting the future climate To this end TRR 181 combines expertise in applied mathematics meteorology and physical oceanography This book provides an overview of representative specific topics addressed by TRR 181 ranging from a review of a coherent hierarchy of models using consistent scaling and approximations and revealing the underlying Hamiltonian structure a systematic derivation and implementation of stochastic and backscatter parameterisations an exploration of the dissipation of large scale mean or eddying balanced flow and ocean eddy parameterisations and a study on gravity wave breaking and mixing the interaction of waves with the mean flow and stratification wave wave interactions and gravity wave parameterisations to topics of a more numerical nature such as the spurious mixing and dissipation of advection schemes and direct numerical simulations of surface waves at the air sea interface In TRR 181 the process oriented topics presented here are complemented by an operationally oriented synthesis focusing on two climate models currently being developed in Germany In this way the goal of TRR 181 is to help reduce the biases in and increase the accuracy of atmosphere and ocean models and ultimately to improve climate models and climate predictions
