Compiler Generators Mads Tofte, 2012-12-06 The Origin of this monograph is a course entitled Semantics directed Compiler Generation which Professor Neil D Jones gave in 1982 at Copenhagen University where I was a student at the time In this course he described a compiler generator called CERES which he was developing I immediately felt attracted to the unusual combination of mathematical reasoning about compilers and the small intricate building blocks that made up the running system As I came to understand the system I discovered that within the existing mathematical framework one could express compiler generation as a special case of compilation this led to a specification of a compiler generator which was bootstrapped on itself resulting in a machine generated compiler generator The purpose of this monograph is to describe the CERES system we produced in 1983-84 and compare it with other systems including more recent ones Also it is as relevant today as it was then to discuss the role of compiler generators as an aid in the design and implementation of programming languages this I do in Chap 5 This monograph is a strongly revised version of the cando scient *Algebraic Methodology and Software Technology* Charles Rattray, Savitri Maharaj, 2004-11-11 This book constitutes the refereed proceedings of the 10th International Conference on Algebraic Methodology and Software Technology AMAST 2004 held in Stirling Scotland UK in July 2004 The 35 revised full papers presented together with abstracts of 5 invited talks and an invited paper were

carefully reviewed and selected from 63 submissions Among the topics covered are all current issues in formal methods related to algebraic approaches to software engineering including abstract data types process algebras algebraic specification model checking abstraction refinement model checking state machines rewriting Kleene algebra programming logic etc *Algorithmic Lie Theory for Solving Ordinary Differential Equations* Fritz Schwarz,2007-10-02 Despite the fact that Sophus Lie's theory was virtually the only systematic method for solving nonlinear ordinary differential equations ODEs it was rarely used for practical problems because of the massive amount of calculations involved But with the advent of computer algebra programs it became possible to apply Lie theory to concrete problems

Artificial Intelligence Ronald Chrisley,Sander Begeer,2000 Topological Geometrodynamics Matti Pitkanen,2006-05 Topological Geometrodynamics is a modification of general relativity inspired by the conceptual problems related to the definitions of inertial and gravitational energy in general relativity Topological geometrodynamics can be also seen as a generalization of super string models Physical space times are seen as four dimensional surfaces in certain eight dimensional space The choice of this space is fixed by symmetries of the standard model so that geometrization of known classical fields and elementary particle quantum numbers results The notion of many sheeted space time allows re interpretation of the structures of perceived world in terms of macroscopic space time topology The generalization of the number concept based on fusion of real numbers and p adic number fields implies a further generalization of the space time concept allowing to identify space time correlates of cognition and intentionality Quantum measurement theory extended to a quantum theory of consciousness becomes an organic part of theory A highly non trivial prediction is the existence of a fractal hierarchy of copies of standard model physics with dark matter identified in terms of macroscopic quantum phases characterized by dynamical and quantized Planck constant The book is a comprehensive overview and analysis of topological geometrodynamics as a mathematical and physical theory

Noncommutative Geometry and Representation Theory in Mathematical Physics Jürgen Fuchs, 2005 Mathematics provides a language in which to formulate the laws that govern nature It is a language proven to be both powerful and effective In the quest for a deeper understanding of the fundamental laws of physics one is led to theories that are increasingly difficult to put to the test In recent years many novel questions have emerged in mathematical physics particularly in quantum field theory Indeed several areas of mathematics have lately become increasingly influential in physics and in turn have become influenced by developments in physics Over the last two decades interactions between mathematicians and physicists have increased enormously and have resulted in a fruitful cross fertilization of the two communities This volume contains the plenary talks from the international symposium on

Noncommutative Geometry and Representation Theory in Mathematical Physics held at Karlstad University Sweden as a satellite conference to the Fourth European Congress of Mathematics The scope of the volume is large and its content is relevant to various scientific communities interested in noncommutative geometry and representation theory It offers a comprehensive view of the state of affairs for these two branches of mathematical physics The book is suitable for graduate students and researchers interested in mathematical physics
