*Combinatorial Algorithms for Integrated Circuit Layout*, 2012-12-06 The last decade has brought explosive growth in the technology for manufacturing integrated circuits Integrated circuits with several hundred thousand transistors are now commonplace This manufacturing capability combined with the economic benefits of large electronic systems is forcing a revolution in the design of these systems and providing a challenge to those people interested in integrated system design Modern circuits are too complex for an individual to comprehend completely Managing tremendous complexity and automating the design process have become crucial issues Two groups are interested in dealing with complexity and in developing algorithms to automate the design process One group is composed of practitioners in computer aided design CAD who develop computer programs to aid the circuit design process The second group is made up of computer scientists and mathematicians who are interested in the design and analysis of efficient combinatorial algorithms These two groups have developed separate bodies of literature and until recently have had relatively little interaction An obstacle to bringing these two groups together is the lack of books that discuss issues of importance to both groups in the same context There are many instances when a familiarity with the literature of the other group would be beneficial Some practitioners could use known theoretical results to improve their cut and try heuristics In other cases theoreticians have published impractical or highly abstracted toy formulations thinking that the latter are important for circuit layout

Advances in Evolutionary Computing Ashish Ghosh, Shigeyoshi Tsutsui, 2012-12-06 The term evolutionary computing refers to the study of the foundations and applications of certain heuristic techniques based on the principles of natural evolution thus the aim of designing evolutionary algorithms EAs is to mimic some of the processes taking place in natural evolution These algorithms are classified into three main categories depending more on historical development than on major functional techniques In fact their biological basis is essentially the same Hence EC GA uGP uES uEP EC Evolutionary Computing GA Genetic Algorithms GP Genetic Programming ES Evolution Strategies EP Evolutionary Programming Although the details of biological evolution are not completely understood even nowadays there is some strong experimental evidence to support the following points Evolution is a process operating on chromosomes rather than on organisms Natural selection is the mechanism that selects organisms which are well adapted to the environment to reproduce more often than those which are not The evolutionary process takes place during the reproduction stage that includes mutation which causes the chromosomes of offspring to be different from those of the parents and recombination which combines the chromosomes of the parents to produce the offspring Based upon these features the previously mentioned three models of evolutionary computing were independently and almost simultaneously developed An evolutionary algorithm EA is an iterative and stochastic process that operates on a set of individuals called a population Artificial Intelligence Chips and Data: Engineering the Semiconductor Revolution for the Next Technological Era Botlagunta Preethish Nandan, 2025-05-07 The 21st
