

THE HORSE'S SKIN is the largest organ of the body. It is composed of the epidermis, the dermis, and the hypodermis. The epidermis is the outermost layer and is composed of stratified squamous epithelium. The dermis is the middle layer and is composed of dense connective tissue. The hypodermis is the innermost layer and is composed of adipose tissue. The skin is covered with hair, sweat glands, and sebaceous glands. The skin is also covered with a network of blood vessels and nerves.

THE HORSE'S MUSCLES are the organs that contract to produce movement. They are composed of muscle fibers, which are long, cylindrical cells with striations. The muscles are innervated by the nervous system and receive their blood supply from the circulatory system.

THE HORSE'S BONES are the rigid structures that support the body and protect the internal organs. They are composed of living tissue and are covered with a layer of bone marrow. The bones are connected to each other by joints, which allow for movement.

THE HORSE'S JOINTS are the points where two or more bones meet. They are classified into three types: fibrous joints, cartilaginous joints, and synovial joints. The most common type of joint in the horse is the synovial joint, which allows for a wide range of movement.

THE HORSE'S DIGESTIVE SYSTEM is the system of organs that takes in food, breaks it down into nutrients, and absorbs them. It consists of the mouth, esophagus, stomach, small intestine, large intestine, and rectum. The horse is a ruminant, which means it has a complex digestive system that allows it to digest tough plant material.

pressure volume work describe the first law of thermodynamics verbally and mathematically solve problems involving the first law of thermodynamics

first law of thermodynamics problem solving khan academy - Jan 10 2023

web davide ghazal 8 years ago you had to find the heat since the work is positive work done on the system and you know that the change in internal energy is negative the average kinetic energy of the gas molecules is lower than it previously was then you are expected to get a negative q heat lost comment 3 votes upvote downvote

web 4 5 when heat flows from the reservoir to the ice the internal mainly kinetic energy of the ice goes up resulting in a higher average speed and thus an average greater position variance of the molecules in the ice the reservoir does become more ordered but due to its much larger amount of molecules it does not offset the change in
