High-Level Adaptation and Aftereffects Rocco Palumbo, Stefania D'Ascenzo, Luca Tommasi, 2017-04-28 Aftereffects generally occur after a prolonged exposure adaptation to a first stimulus possessing one given property followed by presentation of a stimulus bearing a neutral value of that property The aftereffect consists in a change in appearance of the neutral stimulus following the adapter compared to the appearance of the neutral stimulus when it is perceived without any previous exposure to the adapter The transient phenomena of perceptual aftereffects are believed to depend on the activation of neuron populations that respond selectively to a given property of the stimuli Studying how adaptation occurs which stimulus properties are sensitive to it which timings are necessary whether individual differences modulate its occurrence has thus become an indirect way to probe the plasticity of sensory functions in the nervous system recently extending to more cognitive and representational aspects of neural coding In the last two decades indeed it has been demonstrated that aftereffects occur not only for low level properties of stimuli such as motion color or orientation but also for high level properties Many studies have proven that high level proprieties of the stimuli e g gender identity ethnicity or age of a face or a voice are sensitive to this phenomenon It has been shown for example that the prolonged exposure to a female or male face produces a gender misperception in the opposite direction when an

androgynous face is shown after the adapter Furthermore recent studies have also shown that aftereffects are not strictly contingent upon the physical features that make up stimuli but they seem to run across the high level proprieties subjects are adapted to These evidences are supported by cross category adaptation studies which underlie how aftereffects occur even across stimuli that do not share physical features e g bodies and faces but that instead share common higher level properties such as gender Given the growing body of research focused on adaptation and aftereffects in high level perception at the boundaries with perceptual learning attention and cognition the purpose of this topic is to provide a picture of the state of the art relative to the specific phenomena of adaptation in high level perceptual processing

Neural Mechanisms of Perceptual Categorization as Precursors to Speech Perception Einat Liebenthal, Lynne E. Bernstein, 2017-05-03 Perceptual categorization is fundamental to the brain's remarkable ability to process large amounts of sensory information and efficiently recognize objects including speech Perceptual categorization is the neural bridge between lower level sensory and higher level language processing A long line of research on the physical properties of the speech signal as determined by the anatomy and physiology of the speech production apparatus has led to descriptions of the acoustic information that is used in speech recognition e g stop consonants place and manner of articulation voice onset time aspiration Recent research has also considered what visual cues are relevant to visual speech recognition i e the visual counter parts used in lipreading or audiovisual speech perception Much of the theoretical work on speech perception was done in the twentieth century without the benefit of neuroimaging technologies and models of neural representation Recent progress in understanding the functional organization of sensory and association cortices based on advances in neuroimaging

presents the possibility of achieving a comprehensive and far reaching account of perception in the service of language At the level of cell assemblies research in animals and humans suggests that neurons in the temporal cortex are important for encoding biological categories On the cellular level different classes of neurons interneurons and pyramidal neurons have been suggested to play differential roles in the neural computations underlying auditory and visual categorization The moment is ripe for a research topic focused on neural mechanisms mediating the emergence of speech representations including auditory visual and even somatosensory based forms Important progress can be achieved by juxtaposing within the same research topic the knowledge that currently exists the identified lacunae and the theories that can support future investigations This research topic provides a snapshot and platform for discussion of current understanding of neural mechanisms underlying the formation of perceptual categories and their relationship to language from a multidisciplinary and multisensory perspective It includes contributions reviews original research methodological developments pertaining to the neural substrates dynamics and mechanisms underlying perceptual categorization and their interaction with neural processes governing speech perception Digital Badges in Education Lin Y. Invisible, but how? The depth of unconscious processing as inferred from different suppression techniques. Julien Dubois, Nathan Faivre, 2015-02-09 To what level are invisible stimuli processed by the brain in the absence of conscious awareness It is widely accepted that simple visual properties of invisible stimuli are processed however the existence of higher level unconscious processing e.g. involving semantic or executive functions remains a matter of debate Several methodological factors may underlie the discrepancies found in the literature such as different levels of conservativeness in the definition of unconscious or different dependent measures of unconscious processing In this research topic we are particularly interested in yet another factor inherent differences in the amount of information let through by different suppression techniques In the same conditions of well controlled conservatively established invisibility can we show that some of the techniques in the psychophysical magic arsenal e.g. masking but also visual crowding attentional blink etc reliably lead to higher level unconscious processing than others e.g. interocular suppression Some authors have started

investigating this question using multiple techniques in similar settings We argue that this approach should be extended and refined Indeed in order to delineate the frontiers of the unconscious mind using a contrastive method one has to disentangle the limits attributable to unawareness itself and those attributable to the technique inducing unawareness The scope of this research topic is to provide a platform for scientists to contribute insights and further experiments addressing this fundamental question
