Fatigue Testing and Tear Down Operations on AIRBUS A320 Forward Fuselage R. Boetsch, J. Y. Beaufils, AEROSPATIALE TOULOUSE (France), 1991 The structural design substantiation of commercial transport airplane is provided by full static and fatigue analyses supported by testing of complete primary structures The fatigue and damage tolerance testing on full scale specimen representative of production airplane and the teardown inspections performed at the end of the test permit to collect a lot of informations Main objectives of fatigue tests are on one hand to early identify weak

points in primary structure and to quickly define corrective actions on in service and production airplanes on the other hand to check the efficiency of the inspection methods to validate the calculation methods to justify allowable damage scratches dents and typical repairs of structural repair manual to study the propagation of artificial damages which are introduced during the test

Government Reports Announcements & Index ,1992 The Design of Aircraft Landing Gear

Robert Kyle Schmidt,2021-02-18 The aircraft landing gear and its associated systems represent a compelling design challenge simultaneously a system a structure and a machine it supports the aircraft on the ground absorbs landing and braking energy permits maneuvering and retracts to minimize aircraft drag Yet as it is not required during flight it also represents dead weight and significant effort must be made to minimize its total mass The Design of Aircraft Landing Gear written by R Kyle Schmidt PE B A Sc Mechanical Engineering M Sc Safety and Aircraft Accident Investigation Chairman of the SAE A 5 Committee on Aircraft Landing Gear is designed to guide the reader through the key principles of landing system design and to provide additional references when available Many problems which must be confronted have already been addressed by others in the past but the information is not known or shared leading to the observation that there are few new problems but many new people The Design of Aircraft Landing Gear is intended to share much of the existing information and provide avenues for further exploration The design of an aircraft and its associated systems including the landing system involves iterative loops as the impact of each modification to a system or component is evaluated against the whole It is rare to find that the lightest possible landing gear represents the best solution for the aircraft the lightest landing gear may require attachment structures which don t exist and which would require significant weight and compromise on the part of the airframe structure design With those requirements and compromises in mind The Design of Aircraft Landing Gear starts with the study of airfield compatibility aircraft stability on the ground the correct choice of tires followed by discussion of brakes wheels and brake control systems Various landing gear architectures are investigated together with the details of shock absorber designs Retraction kinematics and mechanisms are studied as well as possible actuation approaches Detailed information on the various hydraulic and electric services commonly found on aircraft and system elements such as dressings lighting and steering are also reviewed Detail design points the process of analysis and a review of the relevant requirements and regulations round out the book content The Design of Aircraft Landing Gear is a landmark work in the industry and a must read for any engineer interested in updating specific skills and students preparing for an exciting career
