Concepts of Ecosystem Ecology Lawrence R. Pomeroy,James J. Alberts,2012-12-06 In this volume 19 leading experts offer a timely and coherent overview of the fundamental principles of ecosystem science They examine the flux of energy and biologically essential elements and their associated food webs in major terrestrial and aquatic ecosystems such as forests grasslands cultivated land streams coral reefs and ocean basins In each case interactions between different eosystems predictive models and the application of ecosystem research to the management of natural resources are given special emphasis A number of theoretical chapters provide a synthesis through critical discussion of current concepts of ecosystem energetics and dynamics *Vis Enviro Science EPUB High School 6 Year Access* David M. Elliott,Sonia Chamizo,Vincent John Martin Noah Linus Felde,Andrew David Thomas,2024-08-09 Biological soil crusts biocrusts are widely distributed throughout the world and cover approximately 12% of the terrestrial surface Biocrusts are composed of cyanobacteria algae lichens mosses and a great diversity of other microorganisms which bind soil particles together to form a layer of biological soil matrix on the soil surface typically of several millimetres thickness They are important sites of regional and global microbial diversity and perform multiple ecological functions multifunctionality During

the evolution of terrestrial life on earth biocrusts are regarded as the main colonising photosynthetic organisms before the advent of vascular vegetation They not only represent the early stages of terrestrial ecosystems but also facilitate the ecosystem s development and succession Therefore biocrusts are recognised as ecological engineers in the natural development of ecosystems and for the restoration of degraded terrestrial ecosystems The development of biocrusts is highly heterogeneous which is reflected on both temporal and spatial scales and this heterogeneity is still clearly visible even in a small scale However up to now only limited knowledge is acquired on biocrust temporal and spatial organisation In particular there still is a large knowledge gap regarding the various biocrust communities under different developmental states and their related physiological metabolisms and ecological functions Therefore in depth studies of these issues will undoubtedly further promote our understanding of the heterogeneous development of biocrusts as well as their ecological multifunctionality in terrestrial ecosystems The relevant contributions are expected to provide a scientific basis for the management of biocrusts and technology development e g cyanobacteria induced biocrust technology for ecological restoration and the promotion of soil health
