Studying Tree Responses to Extreme Events Achim Bräuning, Andreas Bolte, Cristina Nabais, Sergio Rossi, Ute Sass-Klaassen, 2017-06-05 Trees are among the longest living organisms They are sensitive to extreme climatic events and document the effects of environmental changes in form of structural modifications of their tissues These modifications represent an integrated signal of complex biological responses enforced by the environment For example temporal change in stem increment integrates multiple information of

tree performance and wood anatomical traits may be altered by climatic extremes or environmental stress. Recent developments in preparative tools and computational image analysis enable to quantify changes in wood anatomical features like vessel density or vessel size. Thus impacts on their functioning can be related to climatic forcing factors. Similarly new developments in monitoring cambial phenology and mechanistic modelling are enlightening the interrelationships between environmental factors, wood formation and tree performance and mortality. Quantitative wood anatomy is a reliable indicator of drought occurrence during the growing season and therefore has been studied intensively in recent years. The variability in wood anatomy not only alters the biological and hydraulic functioning of a tree but may also influence the technological properties of wood with substantial impacts in forestry. On a larger scale alterations of sapwood and phloem area and their ratios to other functional traits provide measures to detect changes in a tree's life functions and increasing risk of drought induced mortality with possible impacts on hydrological processes and species composition of plant communities. Genetic variability within and across populations is assumed to be crucial for species survival in an unpredictable future world. The magnitude of genetic variation and heritability of adaptive traits might define the ability to adapt to climate change. Is there a relation between genetic variability and resilience to climate change? Is it possible to link genetic expression and climate change to obtain deeper knowledge of functional genetics? To derive precise estimates of genetic determinism it is important to define adaptive traits in wood properties and on a whole tree scale. Understanding the mechanisms ruling these processes is fundamental to assess the impact of extreme climate events on forest ecosystems and to provide realistic scenarios of tree responses to changing climates. Wood is also a major carbon sink with a long term residence impacting the global carbon cycle. How well do we understand the link between wood growth dynamics, wood carbon allocation and the global carbon cycle? Papers contributing to this Research Topic will cover a wide range of ecosystems. However special relevance will be given to Mediterranean type areas. These involve coastal regions of four continents making Mediterranean type ecosystems extremely interesting for investigating the potential impacts of global change on growth and for studying responses of woody plants under extreme environmental conditions. For example the ongoing trend towards warmer temperatures and reduced precipitation can increase the susceptibility to fire and pests. The EU funded COST Action STREeSS Studying Tree Responses to extreme Events a Synthesis addresses such crucial tree biological and forest ecological issues by providing a collection of important methodological and scientific insights about the current state of knowledge and by opinions for future research needs.

Autism: The Movement (Sensing) Perspective a Decade Later Elizabeth

B. Torres, Jonathan T. Delafield-Butt, Vikram K. Jaswal, Susan Crawford, Ashok Srinivasan, Brittany Travers, 2025-08-19 A decade ago in 2013 the Research Topic Autism the Movement Perspective proposed the radical idea that using movement and its sensations could help us better understand the many complex layers of autism spectrum disorders Inspired by earlier work from other fields the work positioned front and center approaches from neuromotor control infusing the research with new computational ideas to study autism across the human lifespan Through the lens of motor variability as a form of kinesthetic reafference causal inference and predictive codes the Research Topic brought together a group of researchers parents practitioners and self advocates to rethink autism as sensory motor differences contributing to the emergence of powerful coping mechanisms that advanced our understanding of how the human brain develops and functions Today with new improvements in biosensing technologies and neuroscience and the embodied and affective psychology on which development is based we revisit this Research Topic approaching autism anew through a modernized lens of precision aimed at enabling socio motor agency
