

Graphing and Analyzing Scientific Data

Graphing is an important procedure used by scientist to display the data that is collected during a controlled experiment. There are three main types of graphs:

Pie/circle graphs: Used to show parts of a whole.

Bar graphs: Used to compare amounts.

Line graphs: Use to show the change of one piece of information as it relates to another change.

Both bar and line graphs have an "X" axis (horizontal) and a "Y" axis (vertical).

Parts of a Graph:

Title: Summarizes information being represented in ANY graph.

Independent Variable: The variable that is controlled by the experimenter, such as, time, dates, depth, and temperature. This is placed on the X axis.

Dependent Variable: The variable that is directly affected by the I.V. It is the result of what happens as time, dates, depth and temperature are changed. This is placed on the Y axis.

Scales for each Variable: In constructing a graph, one needs to know where to plot the points representing the data. In order to do this a scale must be employed to include all the data points.

A. Graph the following information in a **BAR** graph. Label and number the x and y-axis appropriately.

Analyzing Genetic Data Answers:

Handbook on Analyzing Human Genetic Data Shili Lin, Hongyu Zhao, 2009-10-13 The discipline of statistical genetics is highly computational. Both exact computational methods and simulation-based or hybrid of the two computational packages are indispensable tools and constant companions of researchers in the field. This handbook is intended to provide human geneticists and other biomedical researchers with guidance on selections of appropriate computational methods and software packages for their specific genetic problems. It may also be used by students and other learners as a reference in conjunction with a more theoretical and/or methodologically oriented textbook. This book tries to strike a balance between methodological expositions and practical guidelines for software selections. Wherever possible, comparisons among the competing methods and software are made to highlight the relative advantages and disadvantages of the approaches so that the reader can make informed choices to best match their specific needs. Human genetics has been undergoing an evolution in the past several years as new knowledge and technologies are transforming the field, leading to numerous new discoveries of genes associated with complex traits such as cancer, obesity, and diabetes. Many recent genome-wide association studies employ the case-control design where the study subjects consist of unrelated affected individuals and normal controls. For each individual, a large number of genetic markers are queried.

Discovered, Not Designed: Building Things in the Age of Complexity Sean McClure,2024-06-25 To build is to be human Creating things is part of our nature and our principal mode of survival The things we have built throughout history have always relied on design to turn discoveries into workable tools But the underlying premise of design is that we can reason about the pieces and connections that make a thing work From the stone

axe to the rocket engine design is predicated on our ability to see causal connections between the parts of a system But what happens when such causality is no longer apparent When the things we must build to solve our challenges have inner workings that cannot be discerned The answer lies in nature Nature fashions truly complex objects that solve categorically hard problems Complex things produce their most important outputs via emergence whereby a system s structures and behaviors arise in ways that cannot be designed This book argues that we are entering an age where humanity must build truly complex things to continue our progress This means learning to build as nature builds and as it turns out forces us to redefine knowledge and skill and more broadly our scientific and engineering paradigm
