Chapter 12

Sensory Organ

- Sense organs have highly specialised nerve cells, which receive stimuli and convert them into appropriate nerve impulses.
- These nerve impulses are carried to the CNS by afferent or sensory nerve fibres.
- sense organs (eyes, ears, tongue, skin, and nose) contain receptors that relay information through sensory neurons to appropriate places within the nervous system.

Following organs are known as sense organs:

1) **Tongue (Taste Bud of Tongue):** To sense the taste.

2) **Eye:** To sense the colour and light.

3) **Nose:** To sense the smell and odour.

4) **Ear:** To sense the sound.

5) **Skin:** To sense the touch, pressure, temperature, and pain.

Organ of Taste (Tongue)

- Tongue is a muscular organ located in the front of the mouth, which helps in chewing and swallowing of food.
- The surface of tongue is covered with small bumps called taste buds, which are considered as the organ of taste.
- Each taste bud contains taste receptor cells.
- Tongue is covered with taste buds, which are distributed all over the surface.
- The taste buds are located in the folds of the tongue, called papillae.
- The taste buds are located in the folds of the tongue, called papillae.

Anatomy & Physiology (includes A&P Online course) E-Book Kevin T. Patton, 2018-01-31 *Anatomy Physiology includes A P Online course E Book*

A Blueprint for the Hard Problem of Consciousness Paulo J. Negro, 2019-02-11 A Blueprint for the Hard Problem of Consciousness addresses the fundamental mechanism that allows physical events to transcend into subjective experiences termed the Hard Problem of Consciousness. Consciousness is made available as the abstract product of self-referent realization of information by strange loops through the levels of processing of the brain. Readers are introduced to the concept of the Hard Problem of Consciousness and related concepts followed by a critical discourse of different theories of consciousness. Next, the author identifies the fundamental flaw of the Integrated Information Theory (IIT) and proposes an alternative that avoids the cryptic intelligent design and panpsychism of the IIT. This author also demonstrates how something can be created out of nothing without resorting to quantum theory while pointing out neurobiological alternatives to the bottom-up approach of quantum theories of consciousness. The book then delves into the philosophy of qualia in different physiological knowledge networks: spatial, temporal, and olfactory cortical signals, for example, to explain an action-based model consistent with the generational principles of Predictive Coding, which maps prediction and predictive error signals for perceptual representations supporting integrated goal-directed behaviors. Conscious experiences are considered the outcome of abstractions realized out of map overlays and provided by sustained oscillatory activity. The key feature of this blueprint is that it offers a perspective of the Hard Problem of Consciousness from the point of view of the subject: the experience of being the subject is predicted to be the realization of inference inversely mapped out of hidden causes of global integrated actions. The author explains the consistencies of his blueprint with ideas of the Global Neuronal Workspace and the Adaptive Resonance Theory of consciousness, as well as with the empirical evidence supporting the Integrated Information Theory. A Blueprint for the Hard Problem of Consciousness offers a unique perspective to readers interested in the scientific philosophy and cognitive neuroscience theory in relation to models of the theory of consciousness.
