Revision Questions & Answers

Name: _____ Date: _____	
1. Define the following terms:	
• Protein	A long chain of amino acids joined by peptide bonds. It is the primary structure of a protein that determines its function.
• Enzyme	A biological catalyst that speeds up chemical reactions in the body without being used up.
• Active site	The specific region of an enzyme where the substrate binds and the reaction takes place.
• Substrate	The substance on which an enzyme acts.
• Product	The substance formed from the reaction of the substrate.
2. Explain the lock and key model of enzyme action.	The lock and key model suggests that the active site of an enzyme is shaped like a lock, and the substrate is shaped like a key. Only the correct key (substrate) can fit into the lock (active site) to start the reaction.
3. Describe the effect of temperature on enzyme activity.	Enzyme activity increases with temperature up to an optimal point, after which it decreases. This is because higher temperatures increase the kinetic energy of molecules, leading to more frequent collisions. However, temperatures above the optimal point denature the enzyme, changing its shape and destroying the active site.
4. Describe the effect of pH on enzyme activity.	Enzyme activity is highest at a specific pH value, known as the optimal pH. Deviations from this optimal pH can lead to denaturation of the enzyme, as the hydrogen ions (H ⁺) can alter the shape of the active site.
