Nature's Gift to Neuroscience Chun-Fang Wu, Joy Alcedo, 2022-02-27 In the 1960s Sydney Brenner proposed to use the nematode worm *Caenorhabditis elegans* to discover the control mechanisms of animal development and to reveal how a small number of neurons generate different behaviours giving birth to a vibrant community that uses this animal model for their studies Brenner was aided in his aim by John Sulston who mapped the *C. elegans* cell lineages from a single cell to the multicellular adult which transformed the field of developmental biology As a tribute to these two men this book captures the perspectives of some of the early pioneers of the worm community from Martin Chalfie Robert Waterston and Donald Moerman to Catherine Rankin Antony Stretton and John White It also includes contributions from subsequent generations of the community who explore the development and function of the *C. elegans* nervous system This book features how this animal has become one of the best models for elucidating the biology of different sensory modalities and their complex behavioural outputs or how this animal s survival strategies have contributed to our understanding of ageing and neurodegeneration Thus this volume documents the development of the *C. elegans* neuroscience field from infancy to maturity The chapters in this book were originally published as a special issue of the *Journal of Neurogenetics*
