Handbook of Constraint Programming Francesca Rossi, Peter van Beek, Toby Walsh, 2006-08-18 Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence computer science databases programming languages and operations research Constraint programming is currently applied with success to many domains such as scheduling planning vehicle routing configuration networks and bioinformatics The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications

A Digital Signal Processor for Particle Detectors Arild Velure, 2021-04-12 To cope with the new running conditions in the

ALICE experiment at the Large Hadron Collider at CERN a new integrated circuit named SAMPA has been created that can process 32 analogue channels convert them to digital perform filtering and compression and transmit the data on high speed links to the data acquisition system The main purpose of this work is to specify design test and verify the digital signal processing part of the SAMPA device to accommodate the requirements of the detectors involved Innovative solutions have been employed to reduce the bandwidth required by the detectors as well as adaptations to ease data handling later in the processing chain The new SAMPA device was built to replace two existing circuits in addition to reducing the current consumption and doubling the amount of processing channels About 50000 of the devices will be installed in the Time Projection Chamber and Muon Chamber detectors in the ALICE experiment
