Nature of Science: "Hemophilia and the Royal Families of Europe" (p. 203)

1. Why is hemophilia called the "bleeder's disease"?
2. How can hemorrhages be stopped?
3. Why has hemophilia often referred to as "the royal disease" and why does the hypothesized pedigree call Queen Victoria's parentage into question?

Genetics, Heredity & Evolution: shared, conserved, fundamental processes and features support the concept of **--common ancestry--** for all organisms. *(Much of the information below will be supported in future units - this is the big picture showing the connections between DNA and evolution, not in text, added in)*

1. These processes and features provide **-evidence-** that all organisms (Archaea, Bacteria, and Eukarya) both extant and extinct, are linked by **-lines of descent-** from common ancestry.
 - a. DNA and RNA are carriers of **-genetic information-** information; the proper storage and transfer of this information are critical for life to continue at the cell, organism and species level.
 - i. Non-eukaryotic chromosomes are **circular**, eukaryotic organisms have multiple linear chromosomes.
 - ii. **-Ribosomes-** are found in all forms of life
 - iii. Viruses have RNA or DNA
 - iv. DNA is **-interchangeable-** between living organism - it can be moved from one organism to another
 - b. A universal genetic **-code-** A, T, G, C, U are the nitrogenous bases found in all living organisms. The CENTRAL DOGMA of genetics states that in ALL life (conserved mechanisms):
 - i. DNA replication ensures the **continuity** of hereditary information
 - ii. Genetic information flows from **-nucleotides-** in a gene to a **-sequence of amino acids-** in a protein (transcription & translation)
 - iii. Phenotypes are determined through **-protein activities-**
 - c. **Metabolic pathways:** ATP (energy).
