Hyman's Comparative Vertebrate Anatomy Libbie Henrietta Hyman,1992-09-15 The purpose of this book now in its third edition is to introduce the morphology of vertebrates in a context that emphasizes a comparison of structure and of the function of structural units The comparative method involves the analysis of the history of structure in both developmental and evolutionary frameworks The nature of adaptation is the key to this analysis Adaptation of a species to its environment as revealed by its structure function and reproductive success is the product of mutation and natural selection the process of evolution The evolution of structure and function then is the theme of this book which presents system by system the evolution of structure and function of vertebrates Each chapter presents the major evolutionary trends of an organ system with instructions for laboratory exploration of these trends included so the student can integrate concept with example

The Visual System of Fish Ron Douglas, Mustafa Djamgoz, 2012-12-06 A question often asked of those of us who work in the seemingly esoteric field of fish vision is why To some of us the answer seems obvious how many other visual scientists get to dive in a tropical lagoon in the name of science and then are able to eat their subjects for dinner However there are better or at least scientifically more acceptable reasons for working on the visual system of fish First in terms of numbers fish are by far the most important of all vertebrate classes probably accounting for over half c 22 000 species of all recognized vertebrate species Nelson 1984 Furthermore many of these are of commercial importance Secondly if one of the research aims is to understand the human visual system animals such as fish can tell us a great deal since in many ways their visual systems and specifically their eyes are similar to our own This is fortunate since there are several techniques such as intracellular retinal recording which are vital to our understanding of the visual process that cannot be performed routinely on primates The cold blooded fish on the other hand is an ideal subject for such studies and much of what we know about for example the fundamentals of information processing in the retina is based on work carried out on fish e g Svaetichin 1953
