

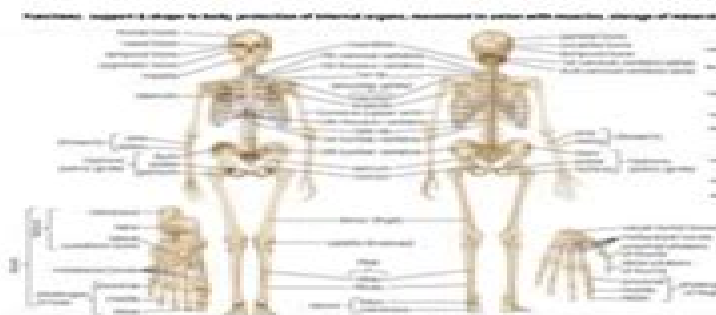

Diagram 3: Joints
 Joints are the points where two or more bones meet. They are classified into three main types: fibrous, cartilaginous, and synovial.
 - **Fibrous Joints:** These joints are formed by dense bands of fibrous tissue that connect the bones. Examples include the sutures of the skull and the syndesmosis between the tibia and fibula.
 - **Cartilaginous Joints:** These joints are formed by cartilage. Examples include the intervertebral discs and the pubic symphysis.
 - **Synovial Joints:** These joints are the most common and allow for the greatest range of movement. They are characterized by a synovial cavity, articular cartilage, and a joint capsule. Examples include the knee, hip, and elbow.

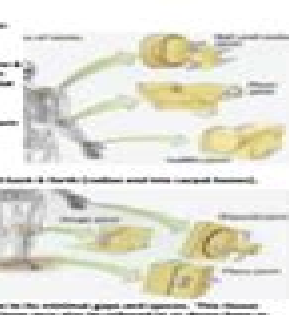

Diagram 6: Bone Structure
 Bone is a complex tissue that provides structural support and protection. It is composed of organic and inorganic components. The organic component includes collagen fibers, which provide tensile strength, and ground substance, which provides a matrix for the inorganic component. The inorganic component is primarily calcium phosphate, which provides hardness and resistance to compression.

Diagram 7: Bone Remodeling
 Bone is a dynamic tissue that constantly undergoes remodeling. This process involves the removal of old bone tissue (resorption) and the formation of new bone tissue (formation). The balance between these two processes determines the overall density and strength of the bone.

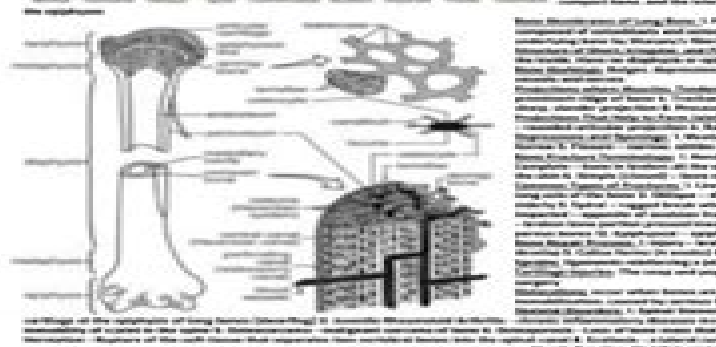

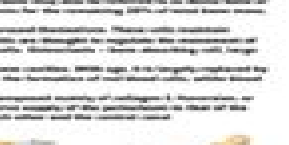

Diagram 10: Bone Tissue Types
 Bone tissue is divided into two main types: compact bone and spongy bone. Compact bone is the dense, outer layer of the bone, while spongy bone is the lighter, inner layer. Both types are composed of osteons, which are the basic structural units of bone.

Diagram 11: Bone Development
 Bones develop from either mesoderm or ectoderm. Most bones develop from mesoderm, while some, such as the skull and mandible, develop from ectoderm. The process of bone development is highly regulated and involves the differentiation of various cell types.

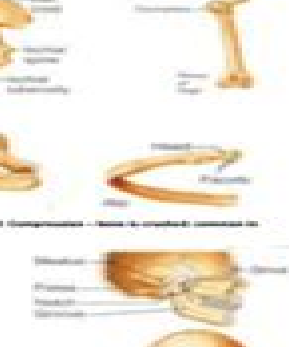

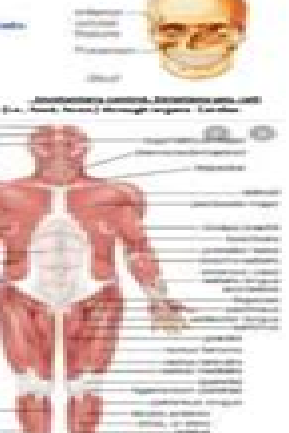

Diagram 14: Muscle Structure
 Muscle is a specialized tissue that contracts to produce movement. It is composed of muscle fibers, which are long, cylindrical cells with multiple nuclei. The fibers are surrounded by a sarcolemma, which is the cell membrane of the muscle fiber.

Diagram 15: Muscle Contraction
 Muscle contraction is the process by which a muscle fiber generates force. This is achieved through the interaction of actin and myosin filaments. The myosin filaments have heads that attach to the actin filaments and pull them towards the center of the sarcomere, causing the muscle to contract.
