

Turtles

by Guy Belleranti

Turtles are reptiles. Reptiles have scales, lay eggs and are ectothermic.

Ectothermic means the animal's body temperature depends on its external environment. If the environment is too warm, the animal must move to where it is cooler. For example, moving from sun to shade. If the environment is too cool, the animal must move to where it is warmer. For example, moving from shade to sun.

The most obvious difference between turtles and other reptiles is its shell. A turtle's shell is part of its skeleton. The shell has three parts. The top rounded section is the carapace. The bottom flatter section is the plastron. These two sections are connected on the sides by "bridges". The shell has nerves and blood vessels. A turtle's shell grows as the turtle grows.

The shell has two layers. The inner layer is made of bones. These bones include the backbone, breastbone and ribs. The outer layer (what we see) is made up of hard scales called scutes. Scutes are made of keratin. Keratin is the same material in our fingernails and hair.

Some turtles can pull their head, legs and feet into their shell for protection.
