

Lab: Energy Dynamics in an Ecosystem

Introduction: The flow of life in an ecosystem is governed, either directly or indirectly, by sunlight. Energy is transferred through chains of producers and consumers, and through decomposers during the process of photosynthesis. These organic compounds are then used as either energy or building blocks for the next trophic level. The flow of energy is unidirectional and is lost as heat at each step. This is also the reason that energy is not recycled in the ecosystem. Heat, the only product of photosynthesis that is the primary product, is lost to the atmosphere as infrared radiation. Heat is transferred between organisms and the environment through conduction, convection, and radiation.

The purpose of this lab is to determine the energy flow in an ecosystem. You will measure the rate of photosynthesis and cellular respiration in a plant. The photosynthesis is measured by the amount of oxygen produced. The rate of cellular respiration is measured by the amount of carbon dioxide produced. The amount of oxygen produced is measured by the amount of oxygen gas that is collected in a test tube. The amount of carbon dioxide produced is measured by the amount of carbon dioxide that is absorbed by a test tube. The amount of oxygen gas that is collected in a test tube is measured by the amount of oxygen gas that is collected in a test tube. The amount of carbon dioxide that is absorbed by a test tube is measured by the amount of carbon dioxide that is absorbed by a test tube. The amount of oxygen gas that is collected in a test tube is measured by the amount of oxygen gas that is collected in a test tube. The amount of carbon dioxide that is absorbed by a test tube is measured by the amount of carbon dioxide that is absorbed by a test tube.

Objectives: To determine the rate of photosynthesis and cellular respiration in a plant. To determine the amount of oxygen gas that is collected in a test tube. To determine the amount of carbon dioxide that is absorbed by a test tube.

Procedure: Follow the following steps to determine the rate of photosynthesis and cellular respiration in a plant.

Step 1: Determining the Rate of Photosynthesis

The rate of photosynthesis is a function of light intensity, carbon dioxide concentration, and temperature. The rate of photosynthesis is measured by the amount of oxygen gas that is collected in a test tube. The amount of oxygen gas that is collected in a test tube is measured by the amount of oxygen gas that is collected in a test tube. The amount of carbon dioxide that is absorbed by a test tube is measured by the amount of carbon dioxide that is absorbed by a test tube. The amount of oxygen gas that is collected in a test tube is measured by the amount of oxygen gas that is collected in a test tube.
