

Floating Leaf Disk Photoynthesis Lab

Experiment with photosynthesis and measure
the rate of photosynthesis in elodea leaves

Introduction

Photosynthesis is a chemical reaction that converts carbon dioxide and water into glucose and oxygen using light energy. The rate of photosynthesis can be measured by the volume of oxygen gas produced. In this experiment, we will use a floating leaf disk assay to measure the rate of photosynthesis in elodea leaves. The leaf disks will be placed in a solution of sodium bicarbonate (NaHCO_3) and exposed to light. As photosynthesis occurs, oxygen gas will be produced, causing the leaf disks to float. The time it takes for the leaf disks to float is a measure of the rate of photosynthesis. This experiment will allow us to investigate the factors that affect the rate of photosynthesis, such as light intensity, carbon dioxide concentration, and temperature.

When light is added to a system, the rate of photosynthesis increases. This is because light provides the energy needed to drive the light-dependent reactions of photosynthesis. The rate of photosynthesis is also affected by the concentration of carbon dioxide and the temperature. The rate of photosynthesis is highest at temperatures between 20°C and 30°C. The rate of photosynthesis is also affected by the concentration of light. The rate of photosynthesis is highest at high light intensities.
