The Importance Of Iron In Pathophysiologic Conditions Raffaella Gozzelino, Paolo Arosio, 2015-06-09 The iron element Fe is strictly required for the survival of most forms of life including bacteria plants and humans Fine tuned regulatory mechanisms for Fe absorption mobilization and recycling operate to maintain Fe homeostasis the disruption of which leads to Fe overload or Fe depletion Whereas the deleterious effect of Fe deficiency relies on reduced oxygen transport and diminished activity of Fe dependent enzymes the cytotoxicity induced by Fe overload is due to the ability of this metal to act as a pro oxidant and catalyze the formation of highly reactive hydroxyl radicals via the Fenton chemistry This results in unfettered oxidative stress generation that by inducing protein lipid and DNA oxidation leads to Fe mediated programmed cell death and organ dysfunction Major and systemic Fe overloads occurring in hemochromatosis and Fe loading anemias have been extensively studied However localized tissue Fe overload was recently associated to a variety of pathologies such as infection inflammation cancer cardiovascular and neurodegenerative disorders In keeping with the existence of cross regulatory interactions between Fe homeostasis and the pathophysiology of these diseases further investigations on the mechanisms that provide cellular and systemic adaptation to tissue Fe overload are instrumental for future therapeutic approaches Thus we encourage our colleagues to submit original research papers reviews perspectives methods and technology reports to contribute their findings to a current state of the art on a comprehensive overview of the importance of iron metabolism in pathophysiologic conditions

The Molecular Pathology of Cognitive Decline: Focus on Metals Paul A. Adlard, Roger Chung, 2016-02-02 In the past two decades there have been significant advances made in understanding the cellular and molecular alterations that occur with brain ageing as well as with our understanding of age related brain diseases Ageing is associated with a mid life decline in many cognitive domains eg Attention working memory episodic memory that progresses with advancing age and which may be potentiated by a variety

of diseases However despite the breadth of attempts to explain it the underlying basis for age related memory impairment remains poorly understood Both normal and pathological ageing as in age related neurodegenerative disorders such as Alzheimer s disease may be associated with overlapping and increased levels of abnormal pathology and this may be a potential mediator of cognitive decline in both populations An emerging hypothesis in this field is that metal ion dys homeostasis may represent a primary unifying mechanism to explain age and disease associated memory impairment either indirectly via an effect on disease pathogenesis or by a direct effect on signaling pathways relevant to learning and memory There remains a concerted worldwide effort to deliver an effective therapeutic treatment for cognitive decline associated with ageing and or disease which is currently an unmet need There have been numerous clinical trials conducted specifically testing drugs to prevent cognitive decline and progression to dementia but to date the results have been less than impressive highlighting the urgent need for a greater understanding of the neurobiological basis of memory impairment in ageing and disease which can then drive the search for effective therapeutics

Computational Neuroscience Drozdostoy Stoyanov,Bogdan Draganski,Paolo Brambilla,Claus Lamm,2023-05-10 This volume looks at the latest advancements in imaging neuroscience methods using magnetic resonance imaging MRI and electroencephalography EEG to study the healthy and diseased brain The chapters in this book are organized into five parts Parts One and Two cover an introduction to this field and the latest use of molecular models Part Three explores neurophysiological methods for assessment such as quantitative EEG and event related potentials Part Four discusses the advances and innovations made in computational anatomy and Part Five addresses the challenges faced by researchers prior to the computational neuroscience to find wider translational applications in the field of psychiatry and mental health In the Neuromethods series style chapters include the kind of detail and key advice from the specialists needed to get successful results in your laboratory Cutting edge and comprehensive Computational Neuroscience is a valuable tool for researchers in the psychiatry and mental health fields who want to learn more about ways to incorporate computational approaches into utility and validity of clinical methods
