Degenerative Aortic Valve Disease, its Mechanism on Progression, its Effect on the Left Ventricle and the Postoperative Results Wilhelm Peter Mistiaen, 2013-01-10 Degenerative aortic valve disease is the most prominent cardiac valve disease in Western societies This volume describes some of the more important issues and problems for this condition its progressive character and the underlying mechanisms of this progression diagnostic difficulties 1 ascertainment of valvular origin of symptoms in elderly 2 the challenge of the low output low gradient syndrome 3 moderate aortic valve calcification during CABG 4 prediction of the rate of progression who will need surgery on short term and who not the burden on the left ventricle and its consequences danger of postponement of surgery the effect and the modalities access types of valves of surgical treatment on survival and QoL the mode of registering postoperative complications determining predictors for valve related non valve related cardiac and non cardiac postoperative complications The e book is a unique presentation specific to degenerative aortic valve disease and its treatment including information about ways to deal with the progressive character of the disease autophagy as a mode of cell death Cardiologists still avoid or delay referring patients to the surgeon for the sake of age left ventricular function or co morbidity Therefore the e book benefits readers by addressing the above issue and providing critical information for changing referral policy which would ultimately enhance postoperative survival of patients suffering from heart valve disease

The Theory and Practice of Auscultation Bernard L. Segal, 1964

Functional Anatomy of Visual Processing in the Cerebral Cortex of the Macaque Koen Nelissen, 2006 In this thesis we examined the monkey cortical regions involved in processing of color visual motion information and the recognition of actions done by others The aim was to gain better insight in the functional organization of the monkey visual cortex using in house developed functional imaging techniques Two different functional imaging techniques were used in these studies the double label deoxyglucose technique DG and functional magnetic

resonance imaging fMRI in the awake monkey Chapter 2 Both techniques allow to obtain an overview of stimulus related neural activity throughout the whole brain integrated over a limited amount of time The results of the color experiments Chapter 3 clearly showed that color related information is processed within a group of areas belonging to the ventral stream which is involved in the perception of objects Color related metabolic activity was observed in visual areas V1 V2 V3 V4 and inferotemporal cortex area TEO and TE These findings set to rest the longstanding controversial claims that color would be processed almost selectively in one extrastriate visual area V4 Zeki SM Brain Res 1973 53 422 427 These results also show the usefulness of whole brain functional mapping techniques as a complimentary approach to single cell measurements In Chapter 4 we investigated which regions in the superior temporal sulcus STS of the monkey are involved in the analysis of motion While the caudal part of the STS has been studied extensively including area MT V5 and MST little is known about motion sensitivity in more anterior ventral STS regions Using fMRI we were able to localize and delineate six different motion sensitive regions in the STS One of these regions that we termed 1st lower superior temporal had not been described so far We were able to further characterize the six motion sensitive regions using a wide variety of motion sensitivity tests The results of the latter tests suggested that motion related information might be processed along a second pathway within the STS in addition to the MT MST path which is involved in the perception of heading This second pathway which includes the more rostral motion sensitive STS regions FST 1st and STPm is possibly involved in the visual processing of biological movements movements of animate objects and actions Finally we investigated how and where in the monkey brain visual information about actions done is processed Chapter 5 and 6 We found Chapter 5 that in agreement with earlier single unit results the observation of grasping movements activates several regions in the premotor cortex of the monkey Remarkable is that these premotor regions predominantly have a motor function coding different types of higher order motor acts for instance grasping of an object These results are in agreement with earlier suggestions that we are able to understand actions done by others because observation of a particular motor act activates our own motor representation of the same act Furthermore these studies suggested that within the frontal cortex of the monkey there is a distinction between context dependent a person grasping and more abstract a hand grasping action representations In Chapter 6 we studied two other regions which are involved in the processing of visual information of actions done by others the superior temporal sulcus STS and the parietal cortex In the parietal cortex we found a similar distinction between context dependent and more abstract action representations as observed in prefrontal cortex These results suggest that the parietal cortex is not only involved in the visual control of action planning but also in the visual processing of actions performed by others Based upon anatomical connections between the STS parietal and frontal regions and motion form and action related functional properties of the former regions we tentatively suggest how information about actions done by others might be sent from the STS to the frontal cortex along three different pathways The latter working hypothesis will be tested in the future by additional fMRI

control experiments and by combining fMRI inactivation and microstimulation experiments while monkeys perform grasping tasks and or view actions performed by others **Equine Anesthesia E-Book** William W. Muir, John A. E.
