

Physiology of Blood Worksheet

Student Name: _____

Time Estimate: 35 minutes

Background

Scientists can determine a person's blood type by adding various serums to the blood and seeing what makes clotting occur.

The serums they add to a blood sample are

- Anti-A (antibodies against antigen A)
- Anti-B (antibodies against antigen B)
- Anti-D (antibodies against Rhesus factor)

If the blood clots when one of these testing serums is added, it means the blood has the blood type matching the serum. For example, if anti-A is added to a blood sample and it clots, the blood sample is either blood type A or blood type AB.

Here is a chart of serum results for all the blood types. A solid well of red blood means no reaction and no clotting. A well with clumps of red indicates a reaction and clotting.

structure of the human system and the conditions upon which health and disease depend as this knowledge will be required in practice in after life It is somewhat unaccountable says Dr Dick and not a little inconsistent that while we direct the young to look abroad over the surface of the earth and survey its mountains rivers seas and continents and guide their views to the regions of the firmament where they may contemplate the moons of Jupiter the rings of Saturn and thousands of luminaries placed at immeasurable distances that we should never teach them to look into themselves to consider their own corporeal structures the numerous parts of which they are composed the admirable functions they perform the wisdom and goodness displayed in their mechanism and the lessons of practical instruction which may be derived from such contemplations Again he says One great practical end which should always be kept in view in the study of physiology is the invigoration and improvement of the corporeal powers and functions the preservation of health and the prevention of disease
