Medical Aspects of Disability and Rehabilitation for Life Care Planning Virgil May III,Richard Bowman,Steven
Barna,2024-05-21 This textbook is an essential resource for life care planners in understanding and assessing a range of
medical disabilities life care planning as a health care service delivery practice certification under the International
Commission on Health Care Certification and the path to rehabilitation for mild to catastrophic injuries Written by a team
composed of expert physicians and doctoral level practitioners the book covers the key areas of traumatic injury and
resultant disability that life care planners so often face From acquired brain injury and spinal disorders to amputation
chronic pain posttraumatic debilitating headaches and plastic reconstructive surgery the book provides a road map not only
to the treatment options available but also the strategies that can lead to rehabilitation and a possible return to work Each
chapter also discusses possible complications allowing a holistic perspective on each issue Also including chapters on
medical cost projection analysis and functional capacity evaluation this is the complete text for both professionals in the
fields of rehabilitation services and life care planning as well as students training to qualify **What can simple brains**
teach us about how vision works Davide Zoccolan,David D. Cox,Andrea Benucci, R. Clay Reid,2015-11-18 Vision is the
process of extracting behaviorally relevant information from patterns of light that fall on retina as the eyes sample the
outside world Traditionally nonhuman primates macaque monkeys in particular have been viewed by many as the animal

model of choice for investigating the neuronal substrates of visual processing not only because their visual systems closely mirror our own but also because it is often assumed that simpler brains lack advanced visual processing machinery. However, this narrow view of visual neuroscience ignores the fact that vision is widely distributed throughout the animal kingdom, enabling a wide repertoire of complex behaviors in species from insects to birds, fish, and mammals. Recent years have seen a resurgence of interest in alternative animal models for vision research, especially rodents. This resurgence is partly due to the availability of increasingly powerful experimental approaches, e.g., optogenetics and two-photon imaging, that are challenging to apply to their full potential in primates. Meanwhile, even more phylogenetically distant species, such as birds, fish, and insects, have long been workhorse animal models for gaining insight into the core computations underlying visual processing. In many cases, these animal models are valuable precisely because their visual systems are simpler than the primate visual system. Simpler systems are often easier to understand, and studying a diversity of neuronal systems that achieve similar functions can focus attention on those computational principles that are universal and essential. This Research Topic provides a survey of the state of the art in the use of animal models of visual functions that are alternative to macaques. It includes original research methods, articles, reviews, and opinions that exploit a variety of animal models, including rodents, birds, fishes, and insects, as well as small New World monkeys, the marmoset, to investigate visual function. The experimental approaches covered by these studies range from psychophysics and electrophysiology to histology and genetics, testifying to the richness and depth of visual neuroscience in non-macaque species.

Progress in Biological Cybernetics Research Daan A. De Jong, 2008.
