Adaptation and Response of Aquatic Animals in the Context of Global Climate Change Hongsheng Yang, John I. Spicer, Juan D. Gaitan-Espitia, 2023-07-24 Anthropogenic climate change has driven widespread changes in marine environments including ocean warming ocean acidification and the formation of hypoxic zones Such environmental changes would pose direct challenges to the survival and adaptation of aquatic organisms greatly affecting the biodiversity of marine life and marine ecosystems Changes in the marine environment are likely to have strong effects at the physiological behavioral and molecular levels with implications at the individual population and species levels resulting in the degradation of genetic resources through massive mortality For example the ingestion digestion respiration and growth of aquatic

animals were greatly depressed under extreme environments In the long run maintaining a sustainable ocean would require a better understanding of the adaptation of marine animals in response to the effects of multiple environmental stressors The Research Topic is aimed to discuss the potential impacts of individual and compounded extreme environments on aquatic animals as well as the regulatory mechanisms and adaptation strategies of marine species to cope with these impacts
