 Each operation must not only be defined but also feasible as specified in criterion 3 An algorithm is a well defined technique
 of calculation in computer science that takes the value or value system as input and returns the value or value system as
 output Consequently an algorithm is a collection of computational operations that transfer data from one form to another An
 algorithm may also be viewed as a tool for tackling a particular computer problem The problem statement generally
 expresses the desired input output connection A specific algorithm can be used to accomplish this input output connection
 Analysis and Design of Algorithms 2 For example we may be required to sort a set of integers in ascending directions This is

a prevalent issue in practice and provides fertile ground for introducing many classic design methodologies and analytical tools This is the formal definition of the sorting issue **Analysis and Design of Algorithms** Singhal Shefali, 2019-09-20
