Submarine Landslides and Tsunamis Ahmet C. Yalçiner, Efim N. Pelinovsky, Emile Okal, Costas E.

Synolakis, 2012-12-06 Tsunamis are water waves triggered by impulsive geologic events such as sea floor deformation landslides slumps subsidence volcanic eruptions and bolide impacts Tsunamis can inflict significant damage and casualties both nearfield and after evolving over long propagation distances and impacting distant coastlines Tsunamis can also effect geomorphologic changes along the coast Understanding tsunami generation and evolution is of paramount importance for protecting coastal population at risk coastal structures and the natural environment Accurately and reliably predicting the initial waveform and the associated coastal effects of tsunamis remains one of the most vexing problems in geophysics and with few exceptions has resisted routine numerical computation or data collection solutions While ten years ago it was believed that the generation problem was adequately understood for useful predictions it is now clear that it is not especially nearfield By contrast the runup problem earlier believed intractable is now well understood for all but the most extreme breaking wave events *Recovery from the Indian Ocean Tsunami* Rajib Shaw, 2014-09-29 During the past 10 years following the 2004 Indian Ocean Tsunami invaluable lessons have been learned and great changes have been observed Immediately after the disaster the second World Conference on Disaster Reduction was held in Kobe Japan and formulated the Hyogo Framework for Action HFA 2005 2015 HFA provided a platform and framework for changes and innovations many of which were part of the recovery programs in the different countries affected by the 2004 disaster This book is a modest attempt to review the lessons learned through the recovery process in the affected region The book has 31 chapters drawing lessons from four countries India Indonesia Sri Lanka and Thailand There are five sections Overview 10 chapters Indonesia 8 chapters India 6 chapters Sri Lanka 5 chapters and Thailand 2 chapters The primary target groups for this book are students and researchers in the fields of disaster risk reduction environment and development The book provides them with a good idea of the current research trends and lessons over the past decade of recovery initiatives Another target group comprises practitioners and policy makers who will be able to apply the knowledge collected here to establishing policy and making decisions *Tsunami* Edward Bryant, 2008-01-29 Tsunamis are underrated as major hazards mainly due to the misconceptions that they occur infrequently and happen along some distant shoreline However evidence for past great tsunami has recently been discovered along apparently aseismic and protected coastlines such as those of Australia and Western Europe This is a comprehensive and well illustrated textbook on all aspects of tsunami It can be used by a student or layperson to gain encyclopedic knowledge about tsunami Probabilistic Tsunami Hazard and Risk Analysis Katsuichiro Goda, Raffaele De Risi, Aditya Riadi Gusman, Ioan Nistor, 2024-10-31 Probabilistic Tsunami Hazard and Risk Analysis Towards Disaster Risk Reduction and Resilience covers recent calls for advances in quantitative tsunami hazard and risk analyses for the synthesis of broad knowledge basis and solid understanding of interdisciplinary fields spanning seismology tsunami

science and coastal engineering These new approaches are essential for enhanced disaster resilience of society under multiple hazards and changing climate as tsunamis can cause catastrophic loss to coastal cities and communities globally This is a low probability high consequence event and it is not easy to develop effective disaster risk reduction measures In particular uncertainties associated with tsunami hazards and risks are large The knowledge and skills for quantitative probabilistic tsunami hazard and risk assessments are in high demand and are required in various related fields including disaster risk management governments and local communities and the insurance and reinsurance industry catastrophe model Focuses on fundamentals on probabilistic tsunami hazard and risk analysis Includes case studies covering a wide range of applications related to tsunami hazard and risk assessments Covers tsunami disaster risk management **Three Great Tsunamis: Lisbon (1755), Sumatra-Andaman (2004) and Japan (2011)** Harsh K. Gupta,Vineet K.

Gahalaut,2014-07-08 Tsunamis are primarily caused by earthquakes Under favourable geological conditions when a large earthquake occurs below the sea bed and the resultant rupture causes a vertical displacement of the ocean bed the entire column of water above it is displaced causing a tsunami In the ocean tsunamis do not reach great heights but can travel at velocities of up to 1000 km hour As a tsunami reaches shallow sea depths there is a decrease in its velocity and an increase in its height Tsunamis are known to have reached heights of several tens of meters and inundate several kilometres inland from the shore Tsunamis can also be caused by displacement of substantial amounts of water by landslides volcanic eruptions glacier calving and rarely by meteorite impacts and nuclear tests in the ocean In this SpringerBrief the causes of tsunamis their intensity and magnitude scales global distribution and a list of major tsunamis are provided The three great tsunamis of 1755 2004 and 2011 are presented in detail The 1755 tsunami caused by the Lisbon earthquake now estimated to range from Mw 8.5 to 9.0 was the most damaging tsunami ever in the Atlantic ocean It claimed an estimated 100 000 human lives and caused wide spread damage The 2004 Sumatra Andaman Mw 9.1 earthquake and the resultant tsunami were the deadliest ever to hit the globe claiming over 230 000 human lives and causing wide spread financial losses in several south and south east Asian countries The 2011 Mw 9.0 Tohoku Oki earthquake and the resultant tsunami were a surprise to the seismologists in Japan and around the globe The height of the tsunami far exceeded the estimated heights It claimed about 20 000 human lives The tsunami also caused nuclear accidents This earthquake has given rise to a global debate on how to estimate the maximum size of an earthquake in a given region and the safety of nuclear power plants in coastal regions This Brief also includes a description of key components of tsunami warning centres progress in deploying tsunami watch and warning facilities globally tsunami advisories and their communication and the way forward **Managing Tourism Crises** Joan C Henderson,2007-01-18 In a world of increasing uncertainty it is vital that managers within the tourism industry are equipped with superior decision making skills and expertise necessary to deal with crisis conditions Tourism Crises provides an effective synthesis of crisis management and tourism research with a solid theoretical foundation It examines the principles

and practices of crisis management within the context of tourism as a multi sector industry Using up to date international case studies it tackles the following areas Political disturbance the relationship between politics and tourism and political inspired tourism crises Social unrest host guest relations and tourists as targets of unrest Economic instability crises arising from fluctuating exchange rates and lack of investor confidence Environmental conditions natural disasters and health crises Technological crises transport accidents and crises arising from technical failure Corporate crises Human resource issues and questions of finance With a user friendly learning structure each chapter will assess the presence of and tendency towards particular types of crisis supported by a series of examples and cases which describe organisational situations challenges and responses Approaches to managing crises will be assessed and appropriate tools and techniques of crisis management are explored enabling readers to gain an insight into this critical aspect of tourism decision making and equipping them with the skills and expertise necessary to deal with crisis conditions

Tourism and Resilience Susan L. Slocum, Carol Kline, 2017-06-09 This is the first book to address the concept of resilience and its specific application and relevance to tourism in particular tourism destinations Resilience relates to the ability of organisms communities ecosystems and populations to withstand the impacts of external forces while retaining their integrity and ability to continue functioning It is particularly applicable to tourism destinations and attractions which are exposed to the potentially harmful and sometimes severe effects of tourism development and visitation but which also can experience increased resilience from the economic benefits of tourism Tourism and Resilience is relevant for researchers students and practitioners in tourism and related fields such as development studies geography sociology anthropology economics and business management Phenomena such as destination communities wildlife populations and ecosystems are discussed as well as the ability of places and communities to use tourism and its infrastructure to recover from disasters such as tsunamis earthquakes unrest and disease
