

The human skeleton is composed of 206 bones, which are divided into the axial skeleton (skull, spine, and rib cage) and the appendicular skeleton (arms and legs). The bones are made of a hard, mineralized tissue called bone, which is constantly being renewed and repaired. The process of bone formation is called ossification, and it occurs in the bone marrow. The bones are connected by joints, which allow for movement. The skeleton provides support, protection, and movement for the body.

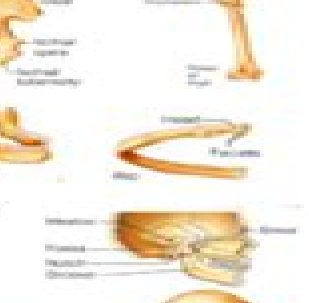

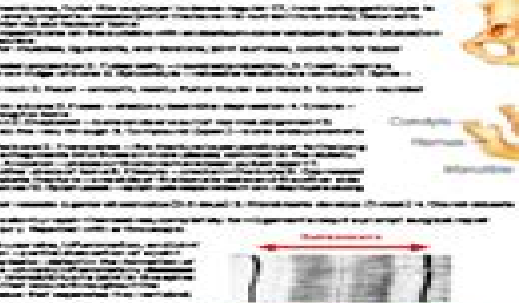

The human arm and hand bones are part of the appendicular skeleton. The humerus is the bone of the upper arm, the radius and ulna are the bones of the forearm, and the carpals, metacarpals, and phalanges are the bones of the hand and fingers. These bones are made of a hard, mineralized tissue called bone, which is constantly being renewed and repaired.

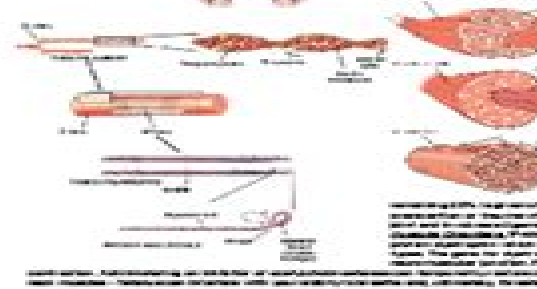

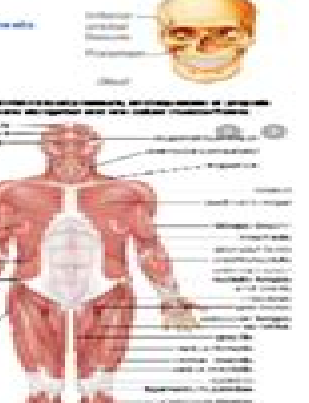

The human leg and foot bones are part of the appendicular skeleton. The femur is the bone of the thigh, the tibia and fibula are the bones of the lower leg, and the tarsals, metatarsals, and phalanges are the bones of the foot and toes. These bones are made of a hard, mineralized tissue called bone, which is constantly being renewed and repaired.

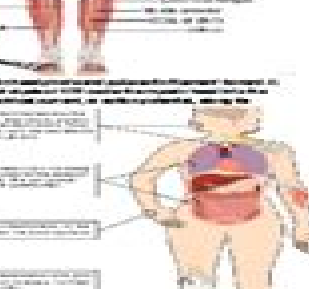

The internal structure of a long bone is composed of the epiphysis (ends) and the diaphysis (shaft). The medullary cavity is the central cavity of the shaft, and the periosteum is the outer layer of the bone. The bone is made of a hard, mineralized tissue called bone, which is constantly being renewed and repaired. The process of bone formation is called ossification, and it occurs in the bone marrow.

The human muscular system is composed of skeletal muscles, which are attached to bones and contract to produce movement. The muscles are made of a soft, fibrous tissue called muscle, which is constantly being renewed and repaired. The process of muscle contraction is called the sliding filament theory, and it occurs in the muscle fibers.
