construction project is one way for a client to take an active part in the realization of SCM in construction. However, in order to study how clients can take an active role towards the realization of SCM in the construction industry, there have to be an understanding of how SCM is to be adopted to the construction industry context. SCM that derives from the manufacturing industry is designed to be used in long-term relationships with permanent organizational structures. The construction industry, on the other hand, is associated with short-term relationships and a temporary organizational structure. Partnering that is designed to mitigate the temporariness and establish long-term relationships have been quite successful in the construction industry and could therefore be used as a facilitator for SCM in construction. To study the use of client-initiated TPL solutions in construction and the realization of SCM in the construction industry, the following research questions have been addressed: RQ1: To what extent can a third-party logistics solution be a facilitator for client-driven SCM in the construction industry? RQ2: How will upstream and downstream tiers be affected when a third-party logistics provider is used in a construction project? RQ3: How can partnering be used as a mean to facilitate the realization of SCM in the construction industry? To answer the research questions, two main methodologies have been used: case study for the empirically grounded research and conceptual studies for the analysis of the case studies as well as for comparing the two concepts of partnering and SCM. All questions have been grounded in literature and previous research. The findings of this research are therefore grounded in both theory and in practice. The main findings of this research are that TPL solutions are not a quick fix for realizing SCM in the construction industry. However, if used right, a TPL solution can be an effective tool to address logistical issues in a construction project and to establish an interface between the supply chain and the construction site. By initiating a TPL solution, the client addresses the importance of logistical competence in a construction project. A TPL solution does not have a purpose of its own; a TPL solution is a service function to the construction project, providing expertise on logistics management. There are also a number of driving forces and concerns that have been identified; if they are addressed prior to a TPL solution being implemented, the likelihood of its success will increase. Furthermore, both partnering and SCM rely on high trust and share several key components and issues that have to be addressed. Partnering on a strategic level with several suppliers included can even be hard to distinguish from SCM. Wherefore, partnering is considered a facilitator for the realization of SCM in construction. By addressing the necessary issues in both concepts, a good foundation for SCM is established.
