

Skin and Body Membranes

Key

Body membranes, which cover body surfaces, line its cavities, and form protective sheets around organs, fall into two major categories. These are epithelial membranes (skin epidermis, mucosae, and serosae) and the connective tissue synovial membranes.

Topics for review in this chapter include a comparison of structure and function of various membranes, anatomical characteristics of the skin (composed of the connective tissue dermis and the epidermis) and its derivatives, and the manner in which the skin responds to both internal and external stimuli to protect the body.

CLASSIFICATION OF BODY MEMBRANES

biomaterial discovery and synthetic biology while providing exciting new views also significantly increases potential risks related to the in vivo reactions to these new materials. For example, the novel materials might have unintended biological activities due to their natural building blocks. In this perspective, the biomaterial field needs: i) better understanding of cell biomaterial interactions at systems level; ii) development of new analysis and testing tools for advanced risk assessment; iii) tools and technologies for modulating reactions to biomaterials; and iv) advanced in vitro models for understanding and testing of reactions to biomaterials. In the following collection of articles, you will find examples of such systems together with comprehensive reviews of current developments in in vitro model systems. The collection also contains articles that elucidate the immune reaction to biomaterials in vitro and in vivo.
