Digital Content Creation Rae Earnshaw, John Vince, 2012-12-06 The very word digital has acquired a status that far exceeds its humble dictionary definition Even the prefix digital when associated with familiar sectors such as radio television photography and telecommunications has reinvented these industries and

provided a unique opportunity to refresh them with new start up companies equipment personnel training and working practices all of which are vital to modern national and international economies The last century was a period in which new media stimulated new job opportunities and in many cases created totally new sectors video competed with film CDs transformed LPs and computer graphics threatened traditional graphic design sectors Today even the need for a physical medium is in question The virtual digital domain allows the capture processing transmission storage retrieval and display of text images audio and animation without familiar materials such as paper celluloid magnetic tape and plastic But moving from these media to the digital domain introduces all sorts of problems such as the conversion of analog archives multimedia databases content based retrieval and the design of new content that exploits the benefits offered by digital systems It is this issue of digital content creation that we address in this book Authors from around the world were invited to comment on different aspects of digital content creation and their contributions form the 23 chapters of this volume **The Vertebrate**

Integument Volume 2 Theagarten Lingham-Soliar, 2015-02-18 The emphasis in this volume is on the structure and functional design of the integument The book starts with a brief introduction to some basic principles of physics mechanics including Newton's Three Laws of Motion These principles are subsequently used to interpret the problems animals encounter in motion It is in only the last 40 or so years that we have begun to understand how important a role the integument plays in the locomotion of many marine vertebrates This involves the crossed fiber architecture which was first discovered in a classic study on nemertean worms As a design principle we see that the crossed fiber architecture is ubiquitous in nature Research on some of the most dynamic marine vertebrates of the oceans tuna dolphins and sharks and the extinct Jurassic ichthyosaurs shows precisely how the crossed fiber architecture contributes to high speed swimming and in lamnid sharks may even aid in energy conservation However this design principle is not restricted to animals in the marine biota but is also found as far afield as the dinosaurs and most recently has been revealed as a major part of the microstructure of the most complex derivative of the integument the feather We see that a variety of phylogenetically diverse vertebrates take to the air by using skin flaps to glide from tree to tree or to the ground and present detailed descriptions of innovations developed in pursuit of improved gliding capabilities in both extinct and modern day gliders But the vertebrate integument had even greater things in store namely true or flapping flight Pterosaurs were the first vertebrates to use the integument as a membrane in true flapping flight and these interesting extinct animals are discussed on the basis of past and cutting edge research most intriguingly with respect to the structure of the flight membrane Bats the only mammals that fly also employ integumental flight membranes Classic research on bat flight is reviewed and supplemented with the latest research which shows the complexities of the wing beat cycle to be significantly different from that of birds as revealed by particle image velocimetry The book's largest chapter is devoted to birds given that they make up nearly half of the over 22 000 species of tetrapods The flight apparatus of birds is unique in nature and is described in great detail with innovative

research highlighting the complexity of the flight structures bird flight patterns and behavior in a variety of species This is complimented by new research on the brains of birds which shows that they are more complex than previously thought The feather made bird flight possible and was itself made possible by keratin contributing to what may be a unique biomechanical microstructure in nature a topic discussed in some depth A highly polarized subject concerns the origin of birds and of the feather Alleged fossilized protofeathers primal simple feathers are considered on the basis of histological and taphonomic investigative studies in Chapter 6 Finally in Chapter 7 we discuss the controversies associated with this field of research Professor Theagarten Lingham Soliar works at the Nelson Mandela Metropolitan University Port Elizabeth and is an Honorary Professor of Life Sciences at the University of KwaZulu Natal
