Assessment Anchors: Answer these questions in AT LEAST 2 Complete Sentences

MA.8.2.1.1 Describe and/or predict observed patterns of inheritance (i.e., dominant, recessive, codominance, incomplete dominance, sex-linked, polygenic, and multiple alleles).

Dominant- The trait that will show. **Recessive**- Must be copied for twice (less frequent). **Codominance** both show (like A+ blood type).

Incomplete dominance- when both and neither make sense. Hair texture is related to genes. **Polygenic**- many genes. **Multiple alleles**- more than two alleles put make up the trait.

MA.8.2.1.2 Describe processes that can alter composition or number of chromosomes (i.e., crossing over, nondisjunction, duplication, translocation, deletion, insertion, and inversion).

Crossing over- When the ends of the chromosome switch.

Nondisjunction- Chromosomes don't separate.

Duplication- make an extra chromosome/segment.

Deletion- Lose a chromosome/segment.

Insertion- Add a section.

Inversion- Add a section.

Translocation- Pairs a section called -> 22q11.

MA.8.2.1.3 Describe how genetic mutations alter the DNA sequence and how or they may affect phenotype (e.g., silent, nonsense, frameshift).

Silent mutation- do not change phenotype.

Nonsense- changes sequence that doesn't make sense.

Frameshift- moves what is read to code.

MA.8.2.1.4 Explain how genetic engineering has impacted the fields of medicine, forensics, and agriculture (e.g., selective breeding, gene splicing, cloning, genetically modified organisms, gene therapy).

Marker-Assisted Selection (MAS) in Crop Plants, volume II Ting Peng,Baohua Wang,Muhammad Kashif Riaz Khan ,Peng Chee,2024-06-13 Global climate change reductions in arable land and food security demands that plant breeding will continue to play an imperative role in feeding 9 billion people sustainably by 2050 In order to face this challenge modern plant breeding will necessitate the adoption of new technologies and practices to boost production of cultivated plants by capturing or generating more favorable genetic diversity In crop plants the majority of agronomically important traits are quantitatively inherited controlled by multiple genes each with a small effect quantitative trait loci QTLs The most common approach to pre breeding is to use genetic mapping to identify QTLs for key phenotypic variation followed by introgressing those QTLs into the elite gene pool with marker assisted selection MAS which can enhance the selection criteria of phenotypes comparing to conventional breeding with the selection of genes As the cost of genotyping continues to decline the use of genotyping by sequencing GBS technologies or whole genome re sequencing coupled with the release of the

genome sequences of plant species have permitted the development of dense arrays of single nucleotide polymorphisms SNPs covering the entire genome which have in turn paved the way to genome wide association studies GWAS Meanwhile fine mapping guided by genome sequences of many plant species have facilitated the exploration of functional genes in addition pan genomes constructed from various available resources such as the reference sequence and its variants raw reads and haplotype reference panels provide a new perspective on QTL locations and potential molecular targets for plant breeding Similarly new approaches to marker trait association analyses such as quantitative trait locus sequencing QTL seq and quantitative trait gene sequencing QTG seq that are based on bulked segregant analysis BSA and whole genome resequencing will help accelerate QTL fine mapping and identification of the causal genes In conclusion the tools and strategies for MAS in modern plant breeding have been expanding in recent years By embracing a broad array of conventional and new molecular techniques modern plant breeding has a bright future in delivering new crop cultivars to keep our food fiber and biobased economy diverse and safe

Mysteries of Type I IFN response: benefits versus detriments Arno Müllbacher,Yoichi Furuya,Herbert Patrick Ludewick,2015-07-29 Successful containment of an infection is dependent on both innate and adaptive immune response Cytokines are essential effectors of both of these systems In particular type I interferons IFN I are important components of early innate immunity against an infection However the production of IFN I could serve as a double edge sword either containing an infection or enhancing susceptibility For example IFN I which is essential for early containment of viral infections has been shown to be detrimental to the host during bacterial infections In fact recent significant reports have shown that influenza virus induced IFN I responses can enhance the host susceptibility to secondary bacterial infections These recent reports highlight the expanding immunoregulatory role of IFN I in the host immunity With these recent findings in mind the aim of this research topic is to welcome novel data opinion and literature reviews on the newly identified dual functions of IFN I This research topic will focus on the following areas of IFN I 1 a detrimental role of IFN I during primary bacterial infection 2 a detrimental role of viral infection induced IFN I during secondary bacterial infections 3 evolutionary pressure that drove detrimental IFN I response during primary bacterial infection and 4 does benefit of IFN I responses during primary viral infections outweigh the adverse consequences of IFN I mediated enhanced susceptibility to secondary bacterial infections
