Guo,Xiao Lin Wang,Dilfuza Egamberdieva,Osama Abdalla Abdelshafy Mohamad,2024-05-28 Plant pathogens such as fungi

bacteria viruses nematodes insect pests etc can pose a great threat to plants in agricultural and natural ecosystems

worldwide The plant disease triangle illustrates that pathogenesis in the plant is not only the outcome of the interactions between the plant host and pathogens but also the consequence of their interactions with the microbiomes associated with plant hosts and pathogens Both microbiomes associated with plant host and pathogen regulate plant health and pathogen infection Microbes can play an important role in promoting plant growth and protecting from pathogens and or insects A healthy plant microbiome is crucial for plant survival production nutrient acquisition abiotic or biotic stress tolerance etc

However the microbiome does not always cooperatively interact with plant hosts to promote host health They may also deter plant health or promote pathogenicity by the production of toxins suppressing plant innate immunity or building a symbiotic or mutual relationship with pathogens or insect pests to facilitate the occurrence of plant disease In addition the disease can result in a plant if a susceptible host plant is in intimate association with a virulent pathogen under favorable or altered abiotic or biotic environmental conditions For example growing evidence suggests disease occurrence in plants is often accompanied by changes in the associated microbial community structure composition and even function
