Investigation of Reactions Involving Pentacoordinate Intermediates Peter A Byrne, 2013-02-01 In this thesis the author outlines the discovery of an effect common to representative examples of all Li salt free Wittig Reactions The implications of such a universally applicable effect are that all such Wittig reactions occur through the same mechanism Although the Wittig reaction was first discovered in 1953 its reaction mechanism has never been definitively settled with many different variants proposed and disproved The work in this

thesis shows conclusively that for 2 2 cycloadditions all Wittig reactions occur by the same irreversible mechanism In addition the author also describes a new chromatography free method for the removal of phosphine oxide from the alkene crude product of the Wittig reaction The work in this thesis has led to several publications in high profile journals

Kinetics and Spectroscopy of Carbenes and Biradicals M.S. Platz, 2013-12-14 The development of mechanistic organic chemistry is filled with claims of short lived reactive intermediates connecting starting material to

product In many ways this book represents a personal odyssey of the editor in this area of chemistry I well remember my introduction to organic chemistry as an undergraduate working in the laboratories of Shelton Bank at SUNY Albany in the early 1970s and the excitement and frustration attending the piecing together of the details of a reaction mechanism by working backwards from the stable products of the reaction In those days the reaction and the reactive intermediates flew by too rapidly to permit direct observation Thus it came as something of a revelation to me as a graduate student at Yale that it was possible to slow down a reaction and actually see such ephemeral species as carbenes and biradicals by spectroscopic methods by generating them photochemically at cryogenic temperatures In this monograph several chapters are devoted to low temperature studies Dougherty has described the matrix EPR spectra of biradicals which were pure conjecture only ten years ago Michl and Arnold have described the matrix spectroscopy of cyclobutadiene a molecule that has fascinated organic chemists for over a hundred years They have shown that by using a combination of matrix spectroscopic methods it is possible to learn nearly as much about the structure of cyclobutadiene the prototypical antiaromatic biradicaloid as about that of a common shelf stable reagent
